   4. Ambient and environmental conditions of installation location.

PART 2 - PRODUCTS

2.1 GENERAL MOTOR REQUIREMENTS

A. Comply with requirements in this Section except when stricter requirements are specified in HVAC equipment schedules or Sections.

B. Comply with NEMA MG 1 unless otherwise indicated.

C. Motors mounted outdoors shall be TEFC. Provide motor end covers/shields, when exposed to direct rain.

D. All pump motors, greater than 5 HP, shall be TEFC.

2.2 MOTOR CHARACTERISTICS

A. Duty: Continuous duty at ambient temperature of 40 deg C and at altitude of 3300 feet above sea level.

B. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.

2.3 POLYPHASE MOTORS

A. Description: NEMA MG 1, Design B, medium induction motor.

B. Efficiency: NEMA Premium efficient, as defined in NEMA MG 1 for all motors 1 horsepower and larger.

C. Service Factor: 1.15.

D. Multi-speed Motors: Separate winding for each speed.

E. Rotor: Random-wound, squirrel cage.

F. Bearings: Regreasable, shielded, antifriction ball bearings suitable for radial and thrust loading.

G. Insulation: Class F.

H. Temperature Rise: Matching insulation rating.

I. Code Letter Designation:
   1. Motors 15 HP and Larger: NEMA starting Code F or Code G.
   2. Motors Smaller than 15 HP: Manufacturer's standard starting characteristic.

2.4 POLYPHASE MOTORS WITH ADDITIONAL REQUIREMENTS

A. Motors Used with Reduced-Voltage and Multi-Speed Drive: Match wiring connection requirements for controller with required motor leads. Provide terminals in motor terminal box, suited to control method.

B. Motors Used with Variable Frequency Controllers: Ratings, characteristics, and features coordinated with and approved by drive manufacturer.
   1. Windings: Copper magnet wire with moisture-resistant insulation varnish, designed and tested to resist transient spikes, high frequencies, and short time rise pulses produced by pulse-width modulated inverters.
   2. NEMA Premium-Efficient NEMA Motors, Inverter-Ready: Class B temperature rise; Class F insulation.
   3. Provide a shaft grounding ring. AEGIS SGR bearing protection ring by Electro Static Technology or approved equivalent.

2.5 SINGLE-PHASE MOTORS

A. Motors larger than 1/20 hp shall be one of the following, to suit starting torque and requirements of specific motor application or as scheduled on the drawings:
   1. Permanent-split capacitor.
   2. Split phase.
   3. Capacitor start, inductor run.
   4. Capacitor start, capacitor run
   5. Electronically commutated.

B. Multi-speed Motors: Variable-torque, permanent-split-capacitor type.

C. Bearings: Pre-lubricated, anti-friction ball bearings or sleeve bearings suitable for radial and thrust loading.

D. Motors 1/20 HP and Smaller: Shaded-pole type.

E. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

PART 3 - EXECUTION (Not Applicable)

END OF SECTION 23 0513

SECTION 23 0629

SCROLL WATER CHILLERS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Packaged, air-cooled, electric-motor-driven, scroll water chillers.

1.2 DEFINITIONS

A. COP: Coefficient of performance. The ratio of the rate of heat removal to the rate of energy input using consistent units for any given set of rating conditions.

B. EER: Energy-efficiency ratio. The ratio of the cooling capacity given in terms of Btu/h to the total power input given in terms of watts at any given set of rating conditions.

C. IPLV: Integrated part-load value. A single number part-load efficiency figure of merit calculated per the method defined by ARI 550/590 and referenced to ARI standard rating conditions.

D. kW/Ton: The ratio of total power input of the chiller in kilowatts to the net refrigerating capacity in tons at any given set of rating conditions.

E. NPLV: Nonstandard part-load value. A single number part-load efficiency figure of merit calculated per the method defined by ARI 550/590 and intended for operating conditions other than the ARI standard rating conditions.

1.3 SUBMITTALS

A. Product Data: Include refrigerant, rated capacities, operating characteristics, furnished specialties, and accessories.
   1. Performance at ARI standard conditions and at conditions indicated.
   2. Performance at ARI standard unloading conditions.
   3. Minimum evaporator flow rate.
   4. Refrigerant capacity of water chiller.
   5. Oil capacity of water chiller.
   6. Fluid capacity of evaporator.
   7. Characteristics of safety relief valves.
   8. Minimum entering condenser-air temperature
   9. Performance at varying capacity with constant design entering condenser-air temperature. Repeat performance at varying capacity for different entering condenser-air temperatures, from design to minimum, in 10 deg F increments.

B. Shop Drawings: Complete set of manufacturer's prints of water chiller assemblies, control panels, sections and elevations, and unit isolation. Include the following:
   1. Assembled unit dimensions.
   2. Weight and load distribution.
   3. Required clearances for maintenance and operation.
   4. Size and location of piping and wiring connections.
   5. Wiring Diagrams: For power, signal, and control wiring.

C. Coordination Drawings: Drawings, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
   1. Structural supports.
   2. Piping roughing-in requirements.

3. Wiring roughing-in requirements, including spaces reserved for electrical equipment.
4. Access requirements, including working clearances for mechanical controls and electrical equipment, and tube pull and service clearances.

D. Certificates: For certification required in "Quality Assurance" Article.

E. Source quality-control test reports.

F. Startup service reports.

G. Operation and Maintenance Data: For each water chiller to include in emergency, operation, and maintenance manuals.

H. Warranty: Sample of special warranty.

1.4 QUALITY ASSURANCE

A. ARI Certification: Certify chiller according to ARI 590 certification program.

B. ARI Rating: Rate water chiller performance according to requirements in ARI 550/590, "Water Chilling Packages Using the Vapor Compression Cycle."

C. ASHRAE Compliance:
1. ASHRAE 15 for safety code for mechanical refrigeration.
2. ASHRAE Guideline 3 for refrigerant leaks, recovery, and handling and storage requirements.
3. ASHRAE/IESNA 90.1 for energy efficiency.

D. ASME Compliance: Fabricate and stamp water chiller heat exchangers to comply with ASME Boiler and Pressure Vessel Code.

E. Comply with NFPA 70.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Ship water chillers from the factory fully charged with refrigerant and filled with oil.

1.6 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to provide labor, material and refrigerant to repair or replace components of chillers that fail in materials or workmanship within one (1) year from date of Substantial Completion.

B. Extended Warranties:
1. Complete compressor, parts only.
2. Extended Warranty Period: 2nd through 5th year from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PACKAGED AIR-COOLED WATER CHILLERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawings or a comparable product by one of the following:
1. Carrier Corporation; a United Technologies company.
2. Daikin.
3. Trane.
4. York International Corporation.

B. Chiller Description
   1. The contractor shall furnish and install air-cooled water chiller with scroll compressors as shown as scheduled in the contract documents. The chiller shall be installed in accordance with this specification and perform at the specified conditions as scheduled.

C. Chiller Operation
   1. Chiller shall be able to start and operate in ambient conditions from 0ºF (-18ºC) to 125ºF (52ºF). Wide ambient operation is accomplished with factory installed and tested protection. If field installed wide ambient solution is used, this shall be purchased and installed at contractor expense.
   2. Chiller shall be capable of operating with a leaving solution temperature range 40ºF to 65ºF (4.4 to 20ºC) without glycol.
   3. Chiller shall be capable of starting up with 95ºF (35ºC) entering fluid temperature to the evaporator. Maximum water temperature that can be circulated with the Chiller not operating is 125ºF (52ºC)
   4. Chiller shall provide evaporator freeze protection and low limit control to avoid low evaporator refrigerant temperature trip-outs during critical periods of chiller operation. Whenever this control is in effect, the controller shall indicate that the chiller is in adaptive mode. If the condition exists for more than 30 seconds, a limit warning alarm relay shall energize.
   5. Rapid Restart™ after power restoration. The Chiller shall be capable of starting in 45 seconds.

D. Compressors
   1. Construct chiller using fully hermetic scroll type compressors with R454B optimized and dedicated scroll profile.
   2. Provide direct drive motor cooled by suction gas with only three major moving parts and a completely enclosed compression chamber that leads to increased efficiency.
   3. Each compressor shall have overload protection internal to the compressor.
   4. Each compressor shall include centrifugal oil pump, oil level sight glass, and oil charging valve.
   5. Each compressor will have crankcase heaters installed and properly sized to minimize the amount of liquid refrigerant present in the oil sump during off cycles.

E. Evaporator
   1. The evaporator shall be a high-efficiency, brazed plate-to-plate type heat exchanger consisting of parallel plates. Braze plates shall be stainless steel with copper braze material.
   2. The water side working pressure shall be rated at 150 psig (10.3 bar) and tested at 1.5 times maximum allowable water side working pressure.
   3. The refrigerant side working pressure shall be rated at 460 psig (29.6 bars) and tested at 1.1 maximum allowable refrigerant side working pressure.
   4. Insulate the evaporator with a minimum of 1.25-inch (K=0.28) UV rated insulation. If the insulation is field installed, the additional money to cover material and installation costs in the field should be included in the bid.
   5. Evaporator heaters shall be factory installed and shall protect chiller down to -20ºF (-29ºC). Contractor shall wire separate power to energize heat tape and protect evaporator while chiller is disconnected from the main power.
   6. Provide water drain connection, vent, and fittings. Factory installed leaving water temperature control and low temperature cutout sensors.
   7. Water connections shall be grooved pipe.
   8. Proof of flow shall be provided by the equipment manufacturer, mechanically installed and electrically wired at the factory of origin.
   9. Factory installed cleanable strainer.
   10. Pump package includes: two high-head pumps, VFD, expansion vessels, drainage valves, shut-off valves at entering and leaving connections. The pump package is single point power

integrated into the chiller unit power with a separate factory wired control panel. The control of the pump is integrated into the chiller controller. The chiller controller displays evaporator pump starts and run-times. Freeze protection down to an ambient temperature of -20ºF (-29ºC) is included as standard. The cold parts of the pump package will also be insulated. Designed with one redundant pump, the chiller controls both pumps through a lead/lag and failure/recovery functionality. A variable speed drive is installed in an additional panel to control the pump. The inverter is adjusted upon start up to balance the system flow and head requirements. The purpose is to save on wasted pump energy caused by a traditional balancing valve.

11. The chilled water buffer tank is factory-installed for easy installation at the building site. The tank is engineered for continuous flow and is fully insulated as standard and is designed with freeze protection down to -20ºF (-29ºC). The purpose of the tank is to increase the chilled water circuit inertia, which is necessary with short water loops. A high circuit inertia reduces the compressor's cycling to increase the compressor life span and allow for more precise water temperature accuracy. It also saves energy as compared to hot gas bypass.

F. Fans
   1. Low sound fans shall by dynamically balanced and direct driven.
   2. All condenser fan TEAO motors have permanently lubricated ball bearings and external overload protection.

G. Condenser
   1. The condenser coils shall consist of copper tubes mechanically bonded into plate-type aluminum fins.
   2. The condenser coils shall have an integral sub-cooling circuit and shall be designed for at least 650 psig (44.8 bar) working pressure. Leak tested at 650 psig (44.8 bar).

H. Enclosures/Chiller Construction
   1. Units shall be constructed of a galvanized steel frame with galvanized steel panels and access doors.
   2. Chiller panels, base rails, and control panels shall be finished with a baked-on powder paint. Control panel doors shall have door stays.
   3. Mount starters and Terminal Blocks in a UL 1995 rated weatherproof panel provided with full opening access doors. If a circuit breaker is chosen, it should be a lockable, through-the-door type with an operating handle and clearly visible from outside of chiller indicating if power is on or off.
   4. The coating or paint system shall withstand 500 hours in a salt-spray fog test in accordance with ASTM B117.

I. Chiller Mounted Starter
   1. The starter shall be across-the-line configuration, factory-mounted and fully pre-wired to the compressor motor(s) and control panel.
   2. Unit shall have a single point power connection.
   3. A control power transformer shall be factory-installed and factory-wired to provide unit control power.
   4. Control panel shall be dead front construction for enhanced service technician safety
   5. Unit wiring shall run in liquid-tight conduit.
   6. A molded case standard interrupting capacity circuit breaker shall be factory pre-wired with terminal block power connections and equipped with a lockable external operator handle, making it available to disconnect the chiller from main power.

J. Refrigerant Circuit

1. All chillers shall have two refrigeration circuits, each with two or three (manifolded) compressor on each circuit.
2. Provide for refrigerant circuit:
   a. Liquid line shutoff valve.
   b. Discharge service valve.
   c. Filter.
   d. Liquid line sight glass.
   e. Electronic expansion valve sized for maximum operating pressure.
   f. Charging valve.
3. Full operating charge of R454B and oil.

K. Controls
1. Factory-mounted to the control panel door, the operator interface has an LCD touch-screen display.
2. Display shall consist of a menu driven interface with easy touch screen navigation to organized sub-system reports for compressor, evaporator, and motor information as well as associated diagnostics.
3. The chiller control panel shall provide password protection of all set-points.
4. Chilled water temperature control shall be microprocessor-based, proportional and integral controller to show water and refrigerant temperature, refrigerant pressure, and diagnostics. This microprocessor-based controller is to be supplied with each chiller by the chiller manufacturer.
5. The front of the chiller control panel shall display the following in clear language, without the use of codes, look-up tables, or gauges:
   a. Run time.
   b. Number of starts.
   c. Current chiller operating mode.
   d. Chilled water set point and set point source.
   e. Electrical current limit set point and set point source.
   f. Entering and leaving evaporator water temperatures.
   g. Saturated evaporator and condenser refrigerant temperatures.
   h. Evaporator and condenser refrigerant pressure.
   i. Differential oil pressure.
   j. Phase reversal/unbalance/single phasing and over/under voltage protection.
   k. Low chilled water temperature protection.
   l. High and low refrigerant pressure protection.
   m. Load limit thermostat to limit compressor loading on high return water temperature.
   n. Condenser fan sequencing to automatically cycle fans in response to load, expansion valve pressure, condenser pressure, and differential pressure to optimize chiller efficiency.
   o. Display diagnostics.
   p. Compressors: Status (on/off), %RLA, anti-short cycle timer, and automatic compressor lead-lag.
6. On chiller, mount weatherproof control panel, containing starters, power and control wiring, factory wired with terminal block power connection. Provide primary and secondary fused control power transformer.
7. The chiller controller shall utilize a microprocessor that will automatically take action to prevent chiller shutdown due to abnormal operating conditions associated with evaporator refrigerant temperature, high condensing pressure, and motor current overload.
8. Provide the following safety controls with indicating lights or diagnostic readouts.
   a. Low chilled water temperature protection.
   b. High refrigerant pressure.

c. Loss of chilled water flow.
d. Contact for remote emergency shutdown.
e. Motor current overload.
f. Phase reversal/unbalance/single phasing.
g. Over/under voltage.
h. Failure of water temperature sensor used by controller.
i. Compressor status (on or off)

9. Provide the following operating controls:
   a. A variable method to control capacity in order to maintain leaving chilled water temperature based on PI algorithms. Five-minute solid state anti-recycle timer to prevent compressor from short cycling. Compressor minimum stop-to-start time limit shall be 2 minutes. If a greater than 5-minute start-to-start, or greater than 2-minute stop-to-start timer is included, hot gas bypass shall be provided to ensure accurate chilled water temperature control in light load applications.
   b. Chilled water pump output relay that closes when the chiller is given a signal to start.
   c. Load limit thermostat to limit compressor loading on high return water temperature to prevent nuisance trip outs.
   d. High ambient unloader pressure controller that unloads compressors to keep head pressure under control and help prevent high pressure nuisance trip outs on days when outside ambient is above design.
   e. Compressor current sensing unloader chiller that unloads compressors to help prevent current overload nuisance trip outs.
   f. Low ambient lockout control with adjustable setpoint.
   g. Condenser fan sequencing which adjusts the speed of all fans automatically in response to ambient, condensing pressure and expansion valve pressure differential thereby optimizing chiller efficiency.
10. Provide user interface on the front of the panel. If display is on the inside of the panel, then a control display access door shall be provided to allow access to the display without removal of panels. Provide user interface with a minimum of the following features:
    a. Leaving chilled water setpoint adjustment from LCD input.
    b. Entering and leaving chilled water temperature output.
    c. Pressure output of condenser.
    d. Pressure output of evaporator.
    e. Ambient temperature output.
    f. Voltage output.
    g. Current limit setpoint adjustment from LCD input.
11. The chiller control panel shall provide leaving chilled water temperature reset based upon return water temperature.
12. Digital Communications to BAS system shall consist of a BACnet MS/TP interface via a single twisted pair wiring.
13. The chiller control panel shall provide an alarm relay output that shall energize whenever a fault requiring manual reset is detected by the panel.
14. The chiller control panel shall provide input for leaving chilled water temperature setpoint/chiller demand limit setpoint based upon a 2-10VDC signal from a building automation system.
15. The chiller control panel shall provide an output for chiller Percent Capacity via a 2-10VDC or 4-20mA signal to a building automation system

L. Sound
   1. Acoustics: Manufacturer must provide both sound power and sound pressure data in decibels. Sound pressure data per AHRI 370 must be provided at full load.

2. If manufacturer cannot meet the noise levels, sound attenuation devices and/or barrier walls must be installed to meet this performance level.
3. Provide acoustical treatment for compressor

M. Accessories
1. Chiller shall have full architectural louvers panels.

2.2 PACKAGED REFRIGERANT RECOVERY UNITS

A. Packaged portable unit shall consist of compressor, air-cooled condenser, recovery system, tank pressure gages, filter-dryer, and valving that allows for switching between liquid and vapor recovery mode. Refrigerant recovery unit shall be factory mounted on an ASME-constructed and -stamped refrigerant storage vessel that is sized to hold the full refrigerant charge of the largest water chiller.

2.3 SOURCE QUALITY CONTROL

A. Perform functional test of water chillers before shipping.

B. Factory performance test water chillers, before shipping, according to ARI 550/590, "Water Chilling Packages Using the Vapor Compression Cycle."

C. Factory test and inspect evaporator according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1. Stamp with ASME label.

D. For water chillers located outdoors, rate sound power level according to ARI 370 procedure.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Before water chiller installation, examine roughing-in for equipment support, anchor-bolt sizes and locations, piping, and electrical connections to verify actual locations, sizes, and other conditions affecting water chiller performance, maintenance, and operations.
1. Water chiller locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 WATER CHILLER INSTALLATION

A. Install water chillers on support structure indicated.

B. Equipment Mounting: Install water chiller on concrete bases using elastomeric pads. Comply with requirements in Division 03 Section "Cast-in-Place Concrete."
1. Minimum Deflection: 1/4 inch.
2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
3. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
4. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
5. Install anchor bolts to elevations required for proper attachment to supported equipment.

C. Maintain manufacturer's recommended clearances for service and maintenance.

D. Charge water chiller with refrigerant if not factory charged and fill with oil if not factory installed.

E. Install separate devices furnished by manufacturer and not factory installed.

3.3 CONNECTIONS

A. Comply with requirements in Division 23 Section "Hydronic Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to chiller to allow service and maintenance.

C. Evaporator Fluid Connections: Connect to evaporator inlet with shutoff valve, strainer, flexible connector, thermometer, and plugged tee with pressure gage. Connect to evaporator outlet with shutoff valve, balancing valve, flexible connector, flow switch, thermometer, plugged tee with pressure gage, flow meter, and drain connection with valve. Make connections to water chiller with a union flange or mechanical coupling.

D. Connect each drain connection with a union and drainpipe and extend pipe, full size of connection, to floor drain. Provide a shutoff valve at each connection if required.

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

B. Inspect field-assembled components, equipment installation, and piping and electrical connections for proper assemblies, installations, and connections.

C. Complete installation and startup checks according to manufacturer's written instructions and perform the following:
1. Verify that refrigerant charge is sufficient and water chiller has been leak tested.
2. Verify that pumps are installed and functional.
3. Verify that thermometers and gages are installed.
4. Operate water chiller for run-in period.
5. Check bearing lubrication and oil levels.
6. Verify that refrigerant pressure relief device for chillers installed indoors is vented outside.
7. Verify proper motor rotation.
8. Verify static deflection of vibration isolators, including deflection during water chiller startup and shutdown.
9. Verify and record performance of chilled-water flow and low-temperature interlocks.
10. Verify and record performance of water chiller protection devices.
11. Test and adjust controls and safeties. Replace damaged or malfunctioning controls and equipment.

D. Prepare a written startup report that records results of tests and inspections.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain water chillers. Video record the training sessions.

END OF SECTION 23 0629

SECTION 23 0712

HVAC SYSTEMS INSULATION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. HVAC Piping Insulation.

B. HVAC Equipment Insulation.

C. Duct Insulation.

D. Jackets and Accessories.

1.2 RELATED SECTIONS

A. Section 230062 “Hangers and Supports for HVAC Piping and Equipment”: Insulation Couplings.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include thermal conductivity, water-vapor permeance, thickness, and jackets (both factory- and field- applied).
   1. Provide product description, list of materials and thickness for each service and location.
   2. For adhesives and sealants, documentation including printed statement of VOC content.
   3. Thermal hanger inserts and shields.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data; For qualified installer.

1.5 QUALITY ASSURANCE

A. Applicator Qualifications: Company specializing in performing insulation work with minimum 3 years’ experience.

B. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products according to ASTM E 84, by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
   1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.

1.6 COORDINATION

A. Coordinate sizes and locations of supports, hangers, and insulation shields specified in Section 230062 “Hangers and Supports for HVAC Piping and Equipment.”

B. Coordinate clearance requirements with duct Installer for duct insulation application. Before preparing ductwork Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.

C. Coordinate pipe insulation installation and testing of heat tracing.

PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

A. Comply with requirements in Part 3 insulation application articles for where insulation materials shall be applied. Where more than one insulation material is specified for an application, Contractor may use any of the listed insulation materials for that application.

B. Products shall not contain asbestos, lead, mercury, or mercury compounds.

C. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

2.2 GLASS FIBER, PREFORMED PIPE INSULATION

A. Products: Subject to compliance with the requirements, provide one of the following:
1. Johns Manville; Micro-Lok.
2. Knauf; 1000-Degree Pipe Insulation.
3. Mason Insulation; Alley-K Pipe Insulation.
4. Owens Corning; Fiberglass Pipe Insulation.

B. Insulation: ASTM C547; Type 1, Grade A rigid molded, noncombustible.
1. Glass fibers bonded with a thermosetting resin.
2. 'K' value: ASTM C177, 0.24 at 75 degrees F.
3. Maximum service temperature: 850 degrees F.
4. Maximum moisture absorption: 0.2 percent by volume.

C. Factory-applied jackets:
1. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C 1136, Type I.

D. ASJ Jacket:
1. Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.
2. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

E. Glass-Fiber Adhesive:
1. Comply with MIL-A-3316C, Class 2, Grade A.
2. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.3 CELLULAR GLASS PIPE INSULATION

A. Products: Subject to compliance with the requirements, provide one of the following:
1. Pittsburg Corning Corporation; Foamglass Super K.

B. Insulation: Preformed Pipe Insulation with factory-applied ASJ or ASJ-SSL: Comply with ASTM C 552, Type II, Class 2.
1. 'K' value: 0.29 at 75 degrees F.
2. Minimum service temperature: -450 degrees F.
3. Maximum service temperature: 900 degrees F.
4. Maximum water vapor transmission: 0.00 perm.
5. Maximum moisture absorption: ASTM C240, 0.2 percent by volume.
6. Density: 7.5 lb/cu. ft.
7. Maximum compressive strength: ASTM C240, 87 psi.
8. Factory fabricate shapes according to ASTM C 450 and ASTM C 585.

C. Cellular-Glass Adhesive:
1. Solvent-based resin adhesive, with a service temperature range of minus 75 to plus 300 deg F.
2. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

D. Cellular-Glass Joint Sealants:
1. Materials shall be compatible with insulation materials, jackets, and substrates.

2. Permanently flexible, elastomeric sealant.
3. Service Temperature Range: Minus 100 to plus 300 deg F.
4. Color: White or gray.

2.4 FOAMED PLASTIC PIPE INSULATION

A. Products: Subject to compliance with the requirements, provide one of the following:
1. Armacell LLC; AP Armaflex AP; AP Armaflex FS (Flame Spread).
2. Aeroflex USA; Aerocel.
3. RBX Corporation; Insul-Tube 180.

B. Insulation: ASTM C534, Type 1; flexible, closed-cell, cellular elastomeric insulation, pre-slit or slip on.
1. 'K' value: ASTM C177; 0.27 at 75 degrees F.
2. Minimum service temperature: -70 degrees F.
3. Maximum service temperature: 220 degrees F.
4. Moisture vapor absorption: ASTM D1056; 5.0 percent by weight.
5. Moisture vapor transmission: ASTM E96; 0.10 perm-inches.
6. Flame/Smoke Spread: ASTME E84; 20/50 Flame/Smoke.
7. Connection: Waterproof vapor barrier adhesive.

C. Elastomeric Foam Adhesive:
1. Air dried adhesive, compatible with insulation.
2. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

D. Protective Coating/Jacket: Weather resistant, compatible with insulation or aluminum jacket as scheduled in Part 3-Execution.

E. Do not use indoors unless product meets ASTM E-84 flame spread rating of less than 25 and smoke density rating of less than 50.

2.5 FIELD-APPLIED JACKETS – PIPING AND EQUIPMENT

A. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.

B. PVC Jacket:
1. Manufacturers: Subject to compliance with the requirements, provide one of the following:
a. Johns Manville; Zeston.
b. P.I.C. Plastics; FG Series.
c. Proto PVC Corporation; LoSmoke.
d. Speedline Corporation; SmokeSafe.
2. Jacket: ASTM D1784, one-piece molded type fitting covers and sheet material.
a. Minimum service temperature: 0 degrees F.
b. Maximum service temperature: 150 degrees F.
c. Moisture vapor transmission: ASTM E96; 0.002 perm-inches.
d. Thickness: 20 mil.
e. Connections: Brush on welding adhesive.
f. Color: Off-white, unless scheduled to be color coded.
3. Color: (Speedline)
a. Chilled Water: Light Blue
b. Non-Potable Water: Purple
c. Domestic Cold Water: Pea Green
d. Domestic Hot Water (140F): Dark Gray

e. Domestic Hot Water (120F): Light Gray
f. Domestic Hot Water Return: White

4. Jacket Adhesive: As recommended by jacket material manufacturer.
   a. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
5. Factory-fabricated fitting covers to match jacket if available; otherwise, field fabricate.

C. Metal Jacket:
1. Manufacturers: Subject to compliance with the requirements, provide one of the following:
   a. Childers Brand, Specialty Construction Brands, Inc., a business of H.B. Fuller Company; Metal Jacketing Systems.
   b. ITW Insulation Systems; Aluminum Jacketing.
   c. PABCO Metals Corp; Surefit.
   d. RPR Products, Inc.; Insul-Mate.
   e. VMSI.
2. Aluminum Jacket: Comply with ASTM B 209, Alloy 3003, 3005, 3105, or 5005, Temper H-14.
   a. Factory cut and rolled to size.
   b. Thickness: 0.016-inch sheet.
   c. Finish: 3/16" corrugations.
   d. Joining: Longitudinal slip joints and 2-inch laps.
   e. Factory-Fabricated Fittings: 0.024-inch-thick die shaped fitting covers with factory-attached protective liner.
   f. Metal Jacket Bands: 3/8-inch-wide aluminum.
   g. Vapor Retarder Liner: 3-mil thick, bonded polysurin.
3. Factory-Fabricated Fitting Covers: Same material finish and thickness as jacket. Field fabricate fitting covers only if factory-fabricated not available.

2.6 GLASS FIBER, FLEXIBLE EXTERNAL DUCT WRAP

A. Products: Subject to compliance with the requirements, provide one of the following:
1. Certainteed Corp; Duct Wrap.
2. Johns Manville; Microlite.
3. Knauf Insulation; Duct Wrap.
4. Mason Insulation; Alley Wrap.
5. Owens Corning; All-Service Duct Wrap.

B. Insulation: ASTM C553; flexible, noncombustible blanket.
1. 'K' value: ASTM C518, 0.27 at 75 degrees F.
2. Maximum service temperature: ASTM C411; 250 degrees F.
3. Maximum moisture absorption: ASTM C1104; 5 percent by weight.
4. Density: 1.0 lb/cu.ft.
5. At Contractors option, provide insulation density = 0.75 lb/cu.ft. and increase insulation thickness, as required, to provide installed R-value equal to or greater than insulation with density of 1.0 lb/cu.ft. (e.g. 2.3-inch thick, 0.75 lb/cu.ft. insulation can be substituted for 2.0-inch thick, 1.0 lb/cu.ft. density insulation).

C. Vapor Jacket:
1. FSK: Glass-scrim reinforced laminate of aluminum foil and Kraft paper bound together.
2. Moisture vapor transmission: ASTM E96; 0.02 perm.

D. Vapor Retarder Mastic: Vinyl emulsion type acrylic or mastic, compatible with insulation, white color.

2.7 GLASS FIBER, RIGID BOARD DUCT INSULATION

A. Products: Subject to compliance with the requirements, provide one of the following:
1. Certainteed Corp; Commercial Board.
2. Johns Manville; 800 Series Spin-Glass.
3. Knauf Insulation; Insulation Glass Board.
4. Mason Insulation; AK Board.
5. Owens Corning; Fiberglass 700 Series.

B. Insulation: ASTM C612; rigid, noncombustible board.
1. 'K' value: ASTM C518, 0.23 at 75 degrees F.
2. Maximum service temperature: ASTM C411; 450 degrees F.
3. Maximum moisture absorption: ASTM C1104; 5 percent by weight.
4. Density: 6.0 lb/cu.ft.

C. Vapor Retarder Jacket:
1. FSK: Glass-scrim reinforced laminate of aluminum foil and Kraft paper bound together.
2. Moisture vapor transmission: ASTM E96; 0.02 perm.

D. Indoor Vapor Retarder Mastic: Vinyl emulsion type acrylic, compatible with insulation, white color.

E. Board Fasteners: Galvanized steel impact-applied or welded mechanical fasteners with press-on heads.

2.8 GLASS FIBER DUCT LINER

A. Products: Subject to compliance with the requirements, provide one of the following:
1. Certainteed Corp; ToughGuard.
2. Mason Insulation; Akousti-Liner.
3. Johns Manville.
4. Knauf Insulation.
5. Owens Corning.

B. Insulation: Comply with ASTM C 1071, NFPA 90A, or NFPA 90B; and with NAIMA AH124, "Fibrous Glass Duct Liner Standard."; flexible, noncombustible blanket with acrylic polymer meeting ASTM G21 impregnated surface and edge coat. Air side coating shall be black acrylic, containing an EPA registered antimicrobial agent.
1. 'K' value: ASTM C177 or ASTM C518, maximum .28 at 75 degrees F mean temperature.
2. Maximum service temperature: 250 degrees F.
3. Maximum velocity on coated air side: 5,000 fpm.
4. Minimum noise reduction criteria: ASTM C1071; 0.45 for 1-inch thickness.
5. Density: 1.5 lb/cu.ft.
6. Antimicrobial Erosion-Resistant Coating: Apply to the surface of the liner that will form the interior surface of the duct to act as a moisture repellent and erosion-resistant coating. Antimicrobial compound shall be tested for efficacy by an NRTL and registered by the EPA for use in HVAC systems.
a. Fungi and Bacteria Resistance: No growth per ASTM E665, G21, and G22.

C. Insulation Pins and Washers:
1. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.135-inch- diameter shank, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.

2. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch-thick galvanized steel; with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2-inches in diameter.

D. Adhesive:
1. Waterproof, ASTM C196 fire-retardant type.
2. Comply with NFPA 90A or NFPA 90B and with ASTM C 916. Adhesive shall have a VOC content of 80 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

E. Liner Fasteners: Galvanized steel, impact applied or welded with integral or press-on head.

2.9 EXTERNAL DUCT SOUND INSULATION

A. Products: Subject to compliance with the requirements, provide one of the following:
1. Kinetics; KNM-100AL.
2. Great Lakes Textiles; Vina-Flex FF-100 (Basis of Design)

B. Insulation: flexible, mass loaded vinyl barrier faced with a scrim reinforced foil on one side.
1. Barium Sulfate loaded limp vinyl sound barrier.
2. Sound Transmission Loss (TL), in the 2nd through 7th octave bands equal to or greater than 11, 15, 21, 27, 33, and 39 db respectively, when tested per ASTM-E90-09 as a free hanging barrier.
3. Weight: 1 pound/square foot.
4. Thickness: 0.10 -inch.
5. 'K' value: 0.29 at 70-degree F.
6. Maximum Flame Spread = 25 and maximum smoke development = 50 per ASTM E84.

2.10 MASTICS

A. Materials shall be compatible with insulation materials, jackets, and substrates; comply with MIL-C-19565C, Type II.
1. For indoor applications, use mastics that have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

B. Vapor-Retarder Mastic: Water based; suitable for indoor and jacketed outdoor use on below ambient services.
1. Products:
a. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 30-80/30-90.
b. Vimasco Corporation; 749.
2. Water-Vapor Permeance: ASTM E 96, Procedure B, 0.013 perm at 43-mil dry film thickness.
3. Service Temperature Range: Minus 20 to plus 180 deg F.
4. Solids Content: ASTM D 1644, 58 percent by volume and 70 percent by weight.
5. Color: White.

C. Vapor-Barrier Mastic: Solvent based; suitable for indoor use on below-ambient services.
1. Products: Subject to compliance with requirements, provide one of the following:
a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-30.
b. Eagle Bridges - Marathon Industries; 501.
c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 30-35.
d. Mon-Eco Industries, Inc.; 55-10.
2. Water-Vapor Permeance: ASTM F 1249, 0.05 perm at 35-mil dry film thickness.
3. Service Temperature Range: 0 to 180 deg F.

4. Solids Content: ASTM D 1644, 44 percent by volume and 62 percent by weight.
5. Color: White.

D. Vapor-Barrier Mastic: Solvent based; suitable for outdoor use on below-ambient services.
1. Products: Subject to compliance with requirements, provide one of the following:
a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; Encacel.
b. Eagle Bridges - Marathon Industries; 570.
c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 60-95/60-96.
2. Water-Vapor Permeance: ASTM F 1249,.05 perm 30-mil dry film thickness.
3. Service Temperature Range: Minus 50 to plus 220 deg F.
4. Solids Content: ASTM D 1644, 33 percent by volume and 46 percent by weight.
5. Color: White.

E. Breather Mastic: Water based; suitable for indoor and outdoor use on above-ambient services.
1. Products: Subject to compliance with requirements, provide one of the following:
a. Childers Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; CP-10.
b. Eagle Bridges - Marathon Industries; 550.
c. Foster Brand, Specialty Construction Brands, Inc., a business of H. B. Fuller Company; 46-50.
d. Mon-Eco Industries, Inc.; 55-50.
e. Vimasco Corporation; WC-1/WC-5.
2. Water-Vapor Permeance: ASTM F 1249, 1.8 perms at 0.0625-inch dry film thickness.
3. Service Temperature Range: Minus 20 to plus 180 deg F.
4. Solids Content: 60 percent by volume and 66 percent by weight.
5. Color: White.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of insulation application.
1. Verify that systems to be insulated have been tested and are free of defects.
2. Verify that surfaces to be insulated are clean and dry. Chilled water pipe and equipment shall be at ambient temperature.
3. Pressure and leak test all piping, ductwork and equipment and obtain review and acceptance prior to the application of insulation.
4. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

B. Coordinate insulation installation with the trade installing heat tracing. Comply with requirements for heat tracing that apply to insulation.

3.3 INSTALLATION - GENERAL REQUIREMENTS

A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces, free of voids throughout.

B. Install insulation materials, forms, vapor barriers or retarders, jackets, and thicknesses required for each item of the system as specified in insulation system schedules.

C. Install accessories compatible with insulation materials and suitable for the service.

D. Install insulation with longitudinal seams at top of horizontal runs.

E. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.

F. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
   1. Install insulation continuously through hangers and around anchor attachments.
   2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.
   3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
   4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.

G. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.

H. Install insulation with factory-applied jackets as follows:
   1. Draw jacket tight and smooth.
   2. Cover circumferential joints with 3-inch-wide strips of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4-inches o.c.
   3. Overlap jacket longitudinal seams at least 1-1/2-inches. Install insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward cl-inching staples along edge at 2-inches o.c.
   4. Cover joints and seams with tape, according to insulation material manufacturer's written instructions, to maintain vapor seal.
   5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints, and at ends adjacent to pipe flanges and fittings.

I. For above-ambient services, do not install insulation to the following:
   1. Vibration-control devices.
   2. Testing agency labels and stamps.
   3. Nameplates and data plates.
   4. Manholes.
   5. Handholes.
   6. Cleanouts.
   7. Flanges and unions

3.4 PENETRATIONS

A. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.
   1. Seal penetrations with flashing sealant.
   2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install

insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.

3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least 2-inches.
4. Seal jacket to wall flashing with flashing sealant.

B. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.

C. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Install insulation continuously through penetrations of fire-rated walls and partitions.

1. Seal penetrations through fire-rated assemblies. Comply with requirements in Section 078413 "Penetration Firestopping."

D. Insulation Installation at Floor Penetrations:

1. Pipe: Install insulation continuously through floor penetrations.
2. Seal penetrations through fire-rated assemblies. Comply with requirements in Section 078413 "Penetration Firestopping."

3.5 INSTALLATION – PIPING INSULATION GENERAL

A. Exposed Piping: Locate insulation and cover seams in least visible locations.

B. Insulated pipes conveying fluids below ambient temperature: Insulate entire system including fittings, valves, unions, flanges, strainers, flexible connections, pump bodies, and expansion joints.

C. Fit pipe hangers over insulation.

D. Inserts and Shields:

1. Application: Protect insulated piping at hangers and supports with insulation shield. On pipe sizes over 2-inches, provide insert.
2. Insulation Protection Shield: Galvanized steel formed in half circle to fit insulation. Length and gage as follow:
   a. Up to NPS 4: 12-inches long and 22-gauge.
3. Insulation-Insert Material: Water repellent treated, ASTM C533, Type I calcium silicate; or ASTM C552, Type II cellular glass of same thickness and vapor retarder jacket specified for surrounding insulation. Insert shall be a minimum of 2-inches longer than the shield.
4. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.
5. For Clevis Hangers: Insert shall cover lower 180 degrees of pipe.
6. Option: At Contractor's option, insert may be factory fabricated Thermal Hanger Shield (insulation insert encased in sheet metal shield) equal to Pipe Shield, Inc. "Insulated Pipe Supports."
7. Steel Pipe Saddles: 12-inch-long steel pipe saddle equal to Anvil Figs. 160-165. Tack weld saddles to pipe, fill interior void with insulation that matches adjoining insulation.

E. Exterior Applications: Provide vapor retarder jacket. Insulate fittings, joints, and valves with insulation of like material and thickness as adjoining pipe, and finish with glass mesh reinforced vapor retarder cement. Cover with aluminum jacket with seams located on bottom side of horizontal piping.

3.6 GLASS FIBER PIPE INSULATION APPLICATION

A. For insulation with factory-applied jackets on above-ambient surfaces, Secure with self-sealing longitudinal laps and butt strips with pressure sensitive adhesive. secure laps with outward-cl-inched staples at 6 -inches o.c.

B. Insulate fittings, joints, and valves with molded insulation of like material and thickness as adjacent pipe. Finish with PVC fitting covers.

C. For hot piping do not insulate flanges and unions at equipment, but bevel and seal ends of insulation.

D. For strut-mounted copper piping (NPS 4 and smaller) systems, provide Insulation Couplings per the requirements of Section 230062 “Hangers and Supports for HVAC Piping and Equipment.”

3.7 CELLULAR GLASS PIPE INSULATION APPLICATION

A. Secure each layer of insulation to pipe with wire or bands and tighten bands without deforming insulation materials.

B. Apply to piping with all joints tightly fitted to avoid gaps. All joints to be sealed full depth with mastic.

C. Vapor retarder jacket shall have minimum 2-inch lap on longitudinal joints.

D. For insulation with factory-applied jackets on below ambient services, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

E. Seal end joints with 4-inch-wide butt strips.

F. Seal all laps and butt strips with self-seal or field applied appropriate adhesive.

G. Insulate flanges, valves and fitting with fabricated fitting covers of same material and thickness of adjacent pipe. Securely fasten into place with ½-inch aluminum bands. Finish with glass fab over vinyl acrylic mastic with flooding coat or mastic applied over fabric.

3.8 FOAMED PLASTIC PIPE INSULATION APPLICATION

A. Pipe insulation may be seamless insulation slipped over piping before erection or may be slit longitudinally and installed over erected pipe.

B. Fabricate fittings from mitered sections of pipe insulation.

C. Seal longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

D. Exterior Applications: Paint entire insulation with two coats of manufacturer’s approved weather-resistant protective finish, except where scheduled to have an aluminum jacket.

E. For strut-mounted copper piping (NPS 4 and smaller) systems, provide Insulation Couplings per the requirements of Section 230529 “Hangers and Supports for HVAC Piping and Equipment.”

3.9 FIELD-APPLIED JACKET APPLICATION

A. Aluminum Jacket:
   1. Rivet jacketing in place and band with aluminum or stainless-steel bands 12-inches on center.
   2. Finish fittings on aluminum jacketed lines with vinyl acrylic mastic reinforced with glass fab. Provide preformed aluminum insulation covers for outdoor fittings.
   3. For exterior applications, locate jacket seams on bottom side of horizontal pipes and seal end joints with weatherproof sealant recommended by insulation manufacturer.

B. PVC Jackets:
   1. Install with 1-inch overlap at longitudinal seams and end joints.
   2. For horizontal applications, install with longitudinal seams along top and bottom of tanks and vessels.
   3. Seal with manufacturer’s recommended adhesive.

a. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.

3.10 SCHEDULES – PIPING INSULATION

A. General: Acceptable preformed pipe and tubular insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials listed is Contractor's option.

B. Definitions:
1. Runouts: Runouts to individual terminal units not exceeding 4 feet long. Runouts exceeding 4 feet in length to be insulated same as mains.

C. HVAC Piping
1. Chilled Water Supply and Return, Indoors, Above Grade:
   a. Cellular Glass Pipe Insulation
      1) NPS 2 and smaller: 1-1/2-inch thick.
      2) NPS 2-1/2 and larger: 2-inches thick.
      3) Jacket exposed lines with color coded PVC jacket.
   b. Foamed Plastic Pipe Insulation:
      1) Runouts to Room Fan Coil AC Units: 3/4-inch thick.
2. Chilled Water Supply and Return, Outdoors, Above Grade:
   a. Cellular Glass Pipe Insulation
      1) All pipe sizes: 2-inch thick.
      2) Apply insulation over electric heat trace.
      3) Jacket lines with aluminum jacket.
3. Refrigerant Liquid Lines on Mini Split System, Indoors and Outdoors Above Grade:
   a. Foamed Plastic Pipe Insulation, Indoors Above Grade:
      1) All pipe sizes: 1/2-inch thick.
      2) Coat insulated lines exposed outdoors with Armaflex WB finish or approved equal.
4. AC Unit Drain Lines, Indoors, Above Grade:
   a. Foamed Plastic Pipe Insulation
      1) All pipe sizes: 1/2-inch thick.
5. Non-potable Water Lines Between Backflow Preventer and Connection to System Indoors, Above Grade:
   a. Glass Fiber Pipe Insulation
      1) All pipe sizes: 1-inch thick.
      2) Paint exposed pipe insulation purple.
6. Non-potable Water Lines Outdoors, Above Grade:
   a. Cellular Glass Pipe Insulation
      1) All pipe sizes: 1-inch thick.
      2) Apply insulation over electric heat trace.
      3) Jacket lines with aluminum jacket painted with 1-inch-wide band of purple paint.

3.11 INSTALLATION – EQUIPMENT INSULATION GENERAL

A. Install in accordance with NAIMA Insulation Standards.

B. Factory Insulated Equipment: Do not insulate.

C. Exposed Equipment: Locate insulation and cover seams in least visible locations.

D. Apply insulation close to equipment by grooving, scoring, and beveling insulation. Fasten insulation to equipment with studs, pins, clips, adhesive, wires, or bands.

E. Fill joints, cracks, seams, and depressions with bedding compound to form smooth surface. On cold equipment, use vapor retarder cement.

F. Insulated equipment containing fluids below ambient temperature: Insulate entire system.

G. Finish insulation at supports, protrusions, and interruptions.

H. Nameplates and ASME Stamps: Bevel and seal insulation around; do not insulate over.

I. Equipment Requiring Access for Maintenance, Repair, or Cleaning: Install insulation so it can be easily removed and replaced without damage.

3.12 SCHEDULES - EQUIPMENT INSULATION

A. General: Acceptable equipment insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials listed is Contractor's option.

B. Cold Equipment:

1. Air and Dirt Separator:
   a. Foamed Plastic Insulation: 1-inch thick.
   b. Finish with two coats protective coating.
   c. Install for easy removal of bottom to clean coalescence media.
2. Chiller: Cold Water Surfaces:
   a. Foamed Plastic Insulation: 1-inch thick.
   b. Finish with two coats protective coating painted to match chiller.
   c. Apply to allow easy removal of chiller heads.
3. Chilled Water Expansion Tank:
   a. Foamed Plastic Insulation: 1-inch thick.
   b. Finish with two coats protective coating.
4. Chilled Water Buffer Tank:
   a. Foamed Plastic Insulation: 1-inch thick.
   b. Finish with two coats protective coating.
5. One-shot Combination Chemical Feeder -in chilled Water System:
   a. Foamed Plastic Insulation: 1-inch thick.
   b. Install for easy removal of top to replace filters.
   c. Finish with two coats protective coating.
6. Sidestream Filter -in Chilled Water System:
   a. Foamed Plastic Insulation: 1-inch thick.
   b. Finish with two coats protective coating.
   c. Install for easy removal of top to replace filters.
7. Chilled Water Pumps:
   a. Foamed Plastic Insulation: 1-inch thick.
   b. Applied directly to pump body.
   c. Finish with two coats protective coating painted to match chiller.
8. Strainers -in chilled Water Lines:
   a. Foamed Plastic Insulation: 1-inch thick.
   b. Install for easy removal to service strainer.

9. Flexible Connectors -in chilled Water Lines:
   a. Foamed Plastic Insulation.
   b. Build up insulation to thickness of adjacent pipe insulation. Stagger and seal joints last. Extend insulation 2-inches past joint.
10. Mechanical Joint Couplings -in chilled Water Lines:
   a. Foamed Plastic Insulation 1-inch thick.
   b. Insulation shall extend 2-inches beyond coupling. Build up adjacent sections of insulation so that outer piece is not stretched.

3.13 INSTALLATION – DUCTWORK INSULATION GENERAL

A. General: Acceptable duct insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials listed is Contractor's option.

B. Install in accordance with NAIMA National Insulation Standards.

C. Insulated ductwork conveying air below ambient temperature:
   1. Provide insulation with vapor retarder jackets.
   2. Seal all seams, punctures, and tears with mastic. Do not use pressure sensitive tape.
   3. Continue insulation through non-rated walls, sleeves, hangers, and other duct penetrations.
   4. Insulate entire system including fittings, joints, flanges, exposed sleeves for fire and combination fire and smoke dampers, flexible connections, and expansion joints.

D. Insulated ductwork conveying air above ambient temperature:
   1. Provide with or without standard vapor retarder jacket.
   2. Insulate fittings and joints. Where service access is required, bevel and seal ends of insulation.

3.14 DUCT AND PLENUM LINER APPLICATION

A. Install duct liner in accordance with SMACNA “HVAC Duct Construction Standards.”

B. Duct liner shall be cut to assure overlapped and compressed longitudinal corner joints. Apply liner with coated surface facing the air stream and adhere with 90 percent coverage of adhesive.

C. The liner shall be additionally secured with mechanical fasteners for ducts exceeding 8 -inches interior dimensions:

Velocity	Transversely Around Perimeter	Longitudinally
Up to 2500 FPM	At 4-inches from corners and at intervals not exceeding 12-inches.	At 3-inches from transverse joints and at intervals not exceeding 18 -inches.
From 2501 FPM to 6000 FPM	At 4-inches from corners and at intervals not exceeding 6 -inches.	At 3-inches from transverse joints and at intervals not exceeding 16 -inches.

D. All transverse joints shall have factory-applied edge coating and shall be neatly butted without gaps. Transverse joints, with shop-or field-cuts, shall be coated with adhesive approved by insulation manufacturer. At velocities over 2500 FPM (medium pressure supply air duct), all longitudinal joints shall be coated with adhesive.

E. All exposed leading edges facing the air stream at fan discharge, and at any interval of lined duct preceded by unlined duct, shall have factory-or field-applied edge coating. At velocities above 2500 FPM (medium pressure duct), provide metal nosing that is either channel or ZEE profile, or is

integrally formed from the duct wall, securely installed over transversely oriented liner edges facing the air stream.

F. Seal all punctures, tears, or exposed edges at shop-or field-cuts with adhesive.

G. Duct dimensions shown on drawings are net inside dimensions required for air flow. Increase duct size to allow for insulation thickness.

3.15 GLASS FIBER, EXTERNAL DUCT WRAP APPLICATION

A. Apply duct wrap to ducts pulled snug but not so tight as to compress corners more than ¼-inch.

B. Adjacent sections of duct wrap shall be tightly butted with 2-inch stapling flap overlapping. Seams shall be stapled approximately 6 -inches on center with ½ -inch minimum steel outward clinching staples. Seal all seams, punctures, and tears with mastic. **Do not use pressure sensitive tape**.

C. Where rectangular or flat oval ducts are 24-inches width or greater, insulation shall be additionally secured to the bottom of the duct with mechanical fasteners spaced 18 -inches on center, not more than 3-inches from edge to prevent sagging. Seal fasteners with mastic.

D. Cover standing seams, stiffeners, and braces using same blanket insulation with 2-inch jacket lap, staples, and mastic.

E. At fire dampers, smoke dampers and combination fire and smoke dampers, stop insulation at rated walls, and externally insulate exposed sleeve on both sides of wall and seal insulation vapor tight to duct and wall.

F. Stop and point insulation around access and damper operators to allow operation without disturbing wrapping.

G. Lift ductwork off trapeze hangers and insert spacers.

3.16 GLASS FIBER, RIGID BOARD DUCT INSULATION APPLICATION

A. Apply board insulation to duct with mechanical fasteners located 12-inches on center. Seal all joints, fasteners, tears and punctures with glass cloth and mastic.

B. Cover standing seams, stiffeners and bracing with same insulation and seal vapor tight.

3.17 EXTERNAL DUCT SOUND INSULATION APPLICATION

A. Omit any external insulation called for elsewhere in the Specification or on the Drawings and apply 2-inch-thick rigid board fiberglass insulation: Owens-Corning 703.

B. Apply sound insulation to outside of the 2-inch-thick rigid board duct insulation and secure with acrylic-based spray contact adhesive. In addition to the adhesive, provide metal or nylon bands on each side of radial joints and at a maximum of 26 -inches on center. Banding to be snug, but do not compress insulation beneath the barrier.

C. Joints: At all seams, provide a minimum 2-inch overlap of the retarder material. Alternately, the retarder may be butted together at the joints, with the seam covered by a 2-inch-wide piece of retarder material.

3.18 SCHEDULES – DUCT INSULATION

A. Common Duct Insulation Requirements:

1. Do not line supply duct connections to multi-zone AC units, or supply duct transitions to packaged air handlers, WSHP’s, or other fan outlets less than 6 square feet outlet area. Insulate these transitions with 2-inch thick External Duct Wrap.

2. Conical and straight spin-in connections for round ducts at rectangular mains on both lined and externally insulated ducts: 2-inch thick External Duct Wrap. For low pressure ducts, split insulation at damper rod and seal vapor tight.
3. Fire, Smoke and Combination Fire and Smoke Dampers: On internally insulated ducts, stop duct liner at damper sleeve. Do not extend internal insulation through wall, partitions, or floor. Insulate portions of exposed damper sleeve, on both sides of the wall or floor, with 2-inch thick External Duct Wrap and seal insulation to duct and wall vapor tight.
4. Flexible Duct Connections on Indoor Insulated Duct Systems: 2-inch thick External Duct Wrap.
5. Duct exposed to view in finished spaces shall be factory insulated or insulated with duct liner.
6. Factory Insulated Duct: Field insulation not required unless otherwise noted.

B. Medium Pressure Supply Duct (Operating Pressure > 3-inch w.g.):
1. All Sheet Metal Medium Pressure Supply Duct: 2-inch thick External Duct Wrap.

C. Low Pressure Supply Ducts:
1. All Sheet Metal Low Pressure Supply Duct Not Specified to be Lined or Otherwise Insulated: 2-inch thick External Duct Wrap.
2. Headers and return bends on duct mounted coils and air terminal unit heating coils: 2-inch thick External Duct Wrap except where exposed to view in finished spaces, sheet metal enclosure with ½" thick Duct Liner.
3. Supply plenum mounted on top of supply diffusers: 2-inch thick External Duct Wrap.

D. Return Ducts:
1. Rectangular Return Ducts: 1-inch-thick Duct Liner.
2. Rectangular Return Duct, First 10 Feet Nearest AC Unit: 1-inch-thick Duct Liner.
3. Rectangular Runout from Main to Return Grilles on Externally Insulated Return Duct System: 1-inch-thick Duct Liner, maximum length of 4 feet nearest grille.
4. All Sheet Metal Return Duct Not Specified to be Lined or Otherwise Insulated: 2-inch thick External Duct Wrap.
5. Rectangular Transfer Ducts: 1-inch-thick Duct Liner.

E. Plenum at Weather Louvers:
1. Plenums Exposed in Mechanical Rooms, Etc.: 2-inch Rigid Board External Duct Insulation with FSK jacket.
2. Plenums Not Exposed: 2-inch thick External Duct Wrap.

F. Outside Air Ducts:
1. All Sheet Metal Outside Air Duct Not Specified to be Otherwise Insulated: 2-inch thick External Duct Wrap.

G. General Exhaust Ducts:
1. Rectangular Exhaust Ducts for Inline Fans, First 10 Feet Nearest Fan Intake: 1-inch-thick Duct Liner.
2. Exhaust Duct Between Inline Exhaust Fan and Building Exit Point (Weather louver, roof cap, brick vent, etc.): 2-inch thick External Duct Wrap.
3. Rectangular Runouts from Main to Exhaust Grilles: 1-inch-thick Duct Liner, maximum 4-foot length.

H. External Duct Sound Insulation:
1. Extent as shown on drawings.
2. Supply, return, and outside air ducts, from AC unit first 15-feet upstream or downstream into the occupied space.

SECTION 23 0725

CUSTOM INDOOR AIR-HANDLING UNITS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes variable volume, site-built custom air-handling units with coils for indoor installations.

1.2 SUBMITTAL5S

A. Product Data: For each type of site built custom indoor air-handling unit indicated. Include the following:
   1. Unit dimensions, weights, structural weights, and required clearances.
   2. Fans:
      a. Certified fan-performance curves with system operating conditions indicated.
      b. Certified fan-sound power ratings.
      c. Certified fan-performance ratings with system operating conditions indicated.
      d. Motor ratings, electrical characteristics, and motor and fan accessories.
      e. Specialties and accessories.
      f. Material gages and finishes.
   3. Dampers, including housings and linkages.
   4. Filters with performance characteristics.

B. Shop Drawings:
   1. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
   2. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, and base weights.
   3. Wiring Diagrams: Power, signal, and control wiring.

C. Field quality-control reports from manufacturer.

1.3 QUALITY ASSURANCE

A. Source Limitations: Obtain modular indoor air-handling units through one source from a single manufacturer.

B. Options: Drawings indicate size, profiles, and dimensional requirements of modular indoor air-handling units and are based on the specific system indicated. Refer to Division 01, Section “Product Requirements.”

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

D. NFPA Compliance: Comply with NFPA 90A for design, fabrication, and installation of air-handling units and components.

E. ARI Certification: Modular indoor air-handling units and their components shall be factory tested according to ARI 430, "Central-Station Air-Handling Units," and shall be listed and labeled by ARI.

F. Comply with NFPA 70.

1.4 COORDINATION

A. Coordinate sizes and locations of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

1.5 WARRANTY

A. Provide complete unit parts warranty for one (1) year from startup.

B. Provide extended parts warranty for fan assembly for five (5) years.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Climate Craft.
   2. Multistack.
   3. Temtrol.

2.2 GENERAL

A. Units shall be specifically engineered for final assembly at the job site. Units requiring any field disassembly to access the mechanical room are not acceptable. The equipment's cooling, heating, ventilating, and performance shall meet or exceed that shown on the schedule. Tags and decals to aid in service or to indicate caution areas shall be provided. Electrical wiring diagrams shall be attached to the control panel access doors. Operation and Maintenance manuals shall be furnished with each unit.

2.3 CABINET CONSTRUCTION

A. Site Assembled units: Units shall be provided by a manufacturer in the business of producing factory and site assembled custom air handling equipment and shall be specifically engineered for final assembly at the jobsite. Site assembly shall be accomplished using the same procedures and techniques as would be used by the manufacturer in the factory and shall yield the same performance characteristics. Site assembly techniques that negate thermal break or other performance characteristics shall not be accepted.
   1. The installing contractor shall provide technicians for training at the AHU manufacturer’s facility prior to equipment shipment and/or site assembly shall be supervised by a direct employee of the AHU manufacturer or by a manufacturer-certified technician. All unit warranty coverage shall be the same as for a factory assembled unit.
   2. Complete units shall be shipped, broken down into individual panel and component form and all pieces shall be engineered for site assembly with no disassembly required. Dimensions and weights of critical sized components shall be provided at time of project submission, for review by the engineer and contractor.
   3. All AHU components, assembly instructions, gasket, and assembly hardware shall be provided by the AHU manufacturer. Assembly instructions shall include easy-to-follow photo details. These details shall include:
      a. Detailed unit specific assembly instructions with typical photos of assembly for both unit and component installation
      b. List of tools required for field installation
   4. Panel gasket supplied with the unit shall be a high-quality weather resistant closed-cell EPDM sponge rubber. Units relying on field applied caulk for sealing are not acceptable. Units shall be securely assembled using machine bolts. Units relying on sheet metal binding screws for field assembly are not acceptable.
   5. Units shall be accompanied by detailed bills of material for each pallet and crate, pallet check lists, panel maps, parts, construction information, and document check lists. All major components shall be identified to match the bills of material and packing lists

B. Casing deflection shall not exceed L/200 at +12.0 w.g. in all positive pressure sections and -12.0 w.g. in all negative pressure sections where L is defined as the panel span. Panels shall be designed to deflect no more than 1/200 (.0005” per inch) of span under operating design conditions when

measured at the panel span. Casing shall be rated for 1% leakage at 1.5 times the operating pressure with a maximum overall pressure of 12" wc.

C. The unit shall be constructed either of a 10-gauge galvanized C-channel perimeter rail with rail heights selectable from 5" to 12" in 1" increments or tubular steel in rail heights of 5" and 8".

D. Gasket supplied with the unit shall be a high-quality, weather-resistant closed-cell EPDM sponge rubber. Each section shall include a label to aid in proper field assembly. Floors shall be designed to deflect no more than 1/200 of span under operating conditions.

E. Standard Floors
1. Floors shall be fabricated of 16-gauge ~~G-90 galvanized steel)~~ {aluminum treadplate .125 base, 3/16" or .187 over treads. All floor sheets shall be isolated from the base assembly with an EPDM thermal break gasket.
2. Floors shall be insulated with two-part polyurethane water-impervious foam insulation. If glass fiber insulation is used an underfloor liner shall be provided. An underfloor liner shall also be provided when the bottom of the unit is used as an air tunnel, when the unit is outdoors and installed on a roof curb, or where the bottom of the unit is exposed to the outdoors.
3. Underfloor liner shall be fabricated of 20-gauge G-90 galvanized steel.
4. To allow for added protection from ruptured coils or piping, floors in specified section(s) shall include a 1 ¼" floor drain piped through the perimeter base. The drain connection through the perimeter base shall be 1 ¼" MPT stainless steel.

F. Wall and roof panels standard construction
1. Panels shall be 2" thick double-wall construction. Panel joints shall be sealed with an industrial EPDM gasket to form water and airtight seal.
2. Panels shall be individually removable for service without removing the roof or compromising the integrity of the cabinet wall. Panels shall be joined with 5/16" bolts that can be removed and refastened. Panel attachment with screws is not acceptable. All panels shall utilize thermal break construction between the exterior panel and the interior liner and between the panels and the base and roof frames.
3. For long-term durability, exterior panels shall be a minimum 16-gauge G90 galvanized steel
4. Interior liners shall be a minimum 20-gauge G90 galvanized steel smooth. Panel liners shall be of a single-piece construction and attached to the exterior panels with a full thermal break. To allow for cleaning, no fasteners shall be used on the exposed liner surface. Single wall units are not acceptable

G. Wall and roof panels
1. Interior wall and ceiling panels shall be 2" thick double-wall construction. Panel joints shall be sealed with an industrial EPDM gasket to form water and airtight seal.
2. Panels shall be individually removable for service without removing the roof or compromising the integrity of the cabinet wall. Panels shall be joined with 5/16" bolts that can be removed and refastened. Panel attachment with screws is not acceptable. All panels shall utilize thermal break construction between the exterior panel and the interior liner and between the panels and the base and roof frames.
3. Interior liners shall be a minimum 16 or 20-gauge G90 galvanized steel. Panel liners shall be of a single piece construction and attached to the exterior panels with a full thermal break. To allow for cleaning, no fasteners shall be used on the exposed liner surface. Single wall units are not acceptable.
4. Liquidtite, rigid steel or aluminum conduit (LFMC): NEC 350, UL-94V, UL360, ASTM-e162 and ASTM-e662; interlocked steel/aluminum with PVC jacket shall be used throughout.
5. Fittings: Liquidtite: NEMA FB1, UL514B; steel, zinc plated shall be used throughout. Must be UL and C-UL listed

H. Insulation
1. All wall and roof panels shall be insulated with glass fiber insulation with an R value of 4.2/inch.

I. Access doors shall be provided in all sections of the air-handling unit as indicated in the plan documents. Doors shall be sized as shown on plan drawings, shall be a minimum 2" thick with R13 polyurethane foam insulation and shall be double wall construction using the same material type as the corresponding section. Doors shall comply with the requirements of UL 1995 and NFPA 90. The door frame shall be 0.125" extruded 6063-T5 aluminum. Each door shall be mounted with adjustable die cast aluminum hinges. All doors and mounting frames shall incorporate a thermal break design, and the doors shall seal to a replaceable extruded EPDM sponge rubber gasket. Doors shall open against static pressure or shall include a pressure relief feature on the door latch.
1. The door latch assembly shall consist of a roller cam compression arm with a chrome plated steel inner handle and glass fiber/nylon composite outer handle. One {tool operated} {key operated} lock shall be provided on each fan section access door. All doors shall have a minimum of two latches.

J. The entire unit, including walls, roof, doors, joints, and seams shall include thermal break construction. This construction shall be supported by tested performance producing no condensation on the exterior surface when the air tunnel temperature is 50°F DB under the following exterior conditions
1. $(Th - 50) / (Th - Tdp) < 3.4$.
2. Th = Ambient dry bulb temperature (°F) external to housing
3. Tdp = Ambient dew point temperature (°F) external to housing.

2.4 FAN ASSEMBLIES – DIRECT DRIVE FAN ARRAY

A. Fan Arrays shall be direct-drive, non-overloading SWSI plenum fans designed for industrial duty and suitable for continuous operation.
1. Fans shall be arranged in an array using one or more welded structural steel assemblies and shall be of the size and quantity specified in the unit schedule. Screwed or riveted frames are unacceptable. Fan assemblies shall be attached directly to base structural members.
2. Fan wheels shall have a minimum of 12 airfoil blades for superior sound characteristics and shall be constructed of aluminum to reduce rotational weight and vibration. Fan blades shall be extruded aluminum for uniformity and improved vibration characteristics.
3. Each fan and motor assembly shall be independently isolated within the structural assembly using 1-inch deflection spring isolators. Isolators shall be mounted in a three-point arrangement that provides both vertical and horizontal (thrust) isolation and shall not require field adjustment. If hard mounted or rubber in shear is used in place of internal spring isolations, external isolation of the entire unit is required.
4. A fan inertia base shall be provided, or the fan structure shall exceed an equivalence of 2x mass of the total rotating parts of the fan array. Fan and motor assemblies shall be designed such that no natural frequencies exist within the operating RPM range of the fan, eliminating the need for "lockout" frequency settings in the variable speed drive. The purchasing contractor will be responsible for all costs associated with externally isolating any unit that does not include individual fan isolation.
5. All fan arrays shall meet the minimum motor efficiency, maximum brake horsepower and total motor horsepower values scheduled. All fans shall be selected to operate at a point no higher than 90% of the peak static pressure rating as defined by the fan performance curve at the selected operating speed. Manufacturer must ensure maximum fan RPM is below the first critical speed. Fans shall be Class 2 construction.

6. All fan and motor assemblies shall be dynamically balanced by the manufacturer to a maximum allowable vibration of 0.040 inches per second at design RPM and a maximum 0.080 inches per second overall vibration limit to bring the fan balance in conformance to a BV-5 Grade G1 per ANSI/AMCA 204. In addition, the manufacturer shall ensure that no critical frequencies exist in the fan operating range by varying motor speed in 1Hz increments from design RPM to 50% of design RPM

B. Motors
1. Electrical characteristics and horsepower shall be as specified on the project schedule.
2. Motors shall be Premium Efficiency per NEMA MG1 Table 12-12 TEFC type, shall have NEMA Class F insulation, shall meet NEMA Standard MD-1 Inverter Duty rating, and shall be designed to withstand 1600V peak voltage spikes and rise times ≥0.1 microseconds.
3. Motors shall have grease-lubricated ball bearings designed to deliver a minimum L10 life of 250,000 hours at full load and the maximum operating RPM of the associated fan. Grease zerks and spring-loaded grease relief valves shall be provided in each motor to allow easy bearing lubrication without damaging the seals due to over lubrication.
4. For efficient operation in a direct drive application, motors shall be capable of operating greater than 60HZ to at least the design operating speed of the fan.
5. Motors shall be factory wired to a motor control center for connection to a disconnect switch or VFD. The motor control center shall include for each motor circuit a control device providing overload protection, short circuit protection and a manual disconnect means, and all circuits shall be wired to a common main panel terminal block. All motors shall operate at all times and be controlled in unison, maintaining a consistent and uniform airflow pattern over coils, filters, and other devices.
6. Each motor shall be provided with a shaft grounding device to harmlessly bleed potential induced shaft voltages to ground

C. Warranty
1. All rotating parts shall be warranted by the unit manufacturer for a full five (5) years from date of unit start-up.

2.5 FAN ARRAY CONTROLS

A. Fan arrays shall be controlled using a common control signal, such as the duct static control signal, to modulate the fan speed.

2.6 FAN SPEED CONTROL (NON-ECM ARRAYS)

A. Each variable air volume supply and return fan array shall be provided with an individual variable frequency drive as specified under division 23.

B. Each variable air volume supply and return fan array shall be provided with an individual variable frequency drive. Drives shall be remote mounted with adequate ventilation provided. The VFD shall be self-contained, totally enclosed in a NEMA 1 ventilated cabinet and capable of operation between 0- and 40-degrees C. The VFD shall be 95% efficient at 100% rated output power, 60 Hz. The VFD shall be UL listed

2.7 UNT SOUND POWER

A. Fan sound power levels (dB) for the unit shall not exceed values as specified on the equipment schedule.

B. Unit manufacturer shall provide certified inlet, supply and casing radiated, sound power levels based on the final unit configuration

2.8 COILS

A. Provide complete coil section(s) with service access door(s) as shown on the plan drawings. Coil connections shall extend through the section casing for ease of installation. Coil connections must be sealed from both the inside and exterior surfaces of the panel with the sleeve of the inner seal covering the pipe within the depth of the panel, all to minimize leakage and condensation. An integral double wall galvanized stainless steel air seal which completely seals around the coil casing and extends to the unit pressure bearing surface shall be provided. Air seals/safing materials that are mechanically fastened to the inner liner of the cabinet only shall be constructed of 16 gage materials to match the material type in the appropriate section and shall be gasketed and have fasteners every 3 inches.

B. Multiple, “stacked” coil arrangements must be constructed so as to allow independent removal of any coil without the removal of another within the coil bank.

C. All coils shall meet or exceed the capacities specified on the mechanical schedule and all water coil performances shall be certified in accordance with the AHRI Forced Circulation Air Heating and Air-Cooling Coil certification program which is based on AHRI Standard 410. Face velocities shall not exceed those specified on the mechanical schedule.

D. All cooling coil sections shall include a double sloped drain pan constructed from 304L stainless steel. All corners shall be welded watertight. Coils shall rest on stainless steel supports. The pan shall have a minimum pitch of 2" from high point to the bottom of the drain outlet connection, providing at least a 1/8” per foot slope. The drain pan shall be insulated with a 2-part sprayed on polyurethane, water impervious foam. Insulation shall be applied to the entire under side of the drain pan and coil section base assembly. If multiple stacked coils are used, intermediate drain pans are required. Intermediate pans shall be insulated and drained with 3/4” copper down-comers to the main pan.

E. Water coils shall be of a staggered tube design with high efficiency plate-type fins for maximum performance. All coils shall be tested with 400 psig compressed air under clear water. Coils shall be designed to operate at 300 psig internal pressure and up to 250ºF. Tubes shall be 5/8" diameter, seamless 0.020” wall copper, mechanically expanded into full drawn fin collars for a continuous compression bond over the full finned length for high-efficiency performance. Coil casings shall be a minimum of 16-gauge galvanized steel. Coil casing reinforcements shall be required for fin lengths over 42". Coil fins shall be 0.0075" thick aluminum. Coils shall be serviceable using 0.25" M.P.T. drain and vent taps on the supply and return headers. Threaded seamless red brass coil connections shall be brazed to copper supply and return headers

2.9 FILTERS

A. Provide complete filter section(s) with filter racks and service access door(s) as shown on the plan drawings. Holding frames provided for medium efficiency applications will be either upstream or downstream accessible. Holding frames provided for high-efficiency applications will be upstream accessible, only. Holding frames shall be constructed from heavy gauge galvanized steel and shall be equipped with polyurethane foam gaskets. Frames shall be installed with vertical stiffeners and appropriate frame-to-frame sealant to provide a rigid leak-tight assembly. An integral air seal that completely seals around the filter frame assembly and extends to the unit pressure bearing surface shall be provided. Air seals/safing materials that are mechanically fastened to the inner liner of the cabinet only shall be constructed of 16 gage materials to match the material type in the appropriate section and shall be gasketed and have fasteners every 3 inches.

Filter fasteners shall be capable of being installed without the requirement of tools, nuts, or bolts. The holding frame shall be designed to accommodate standard-size filters with the application of the appropriate type of fastener. The filter rack shall be designed to use standard 24”x24” and 12”x24” filters only. Odd-sized filters are not allowed. Holding frame assemblies shall be sized to meet or exceed the face area specified by the mechanical schedule.

B. Angle filter racks shall be provided. Angle racks shall be fabricated from a minimum of 16-gauge galvanized steel. Angle racks shall be applied in medium-sized filter applications and will be either upstream or side accessible. Upstream access filter racks shall have one central access cover per row of filters, centered in the unit for easy access. Side access filter racks over 72" long shall include an angle center reinforcement support. Filter racks shall be sized to meet or exceed the area specified in the mechanical schedule. The filter rack shall be designed to use standard 24”x20” and 12”x20” filters only. Odd-sized filters are not allowed.

C. Gauges
   1. A Magnehelic differential pressure gauge shall be provided factory-installed for measuring the pressure drop across each filter bank-single stage. The gauge shall be a diaphragm-actuated dial type, 4¾" O.D., with white dial, black figures and graduations and pointer zero adjustment.
   2. An inclined differential pressure gauge shall be provided factory installed for measuring the pressure drop across each filter bank-single stage. The gauge shall be liquid filled inclined type with black figures, graduations, and pointer zero adjustment.

D. Medium efficiency pleated filters shall be 2" thick, 30% efficient MERV 8 as rated by ASHRAE Standard 52.1 test methods. Filter media shall be of the non-woven cotton fabric type. The filter shall have an average efficiency of 25-30 %. Filters shall be UL900 Class2 listed .

E. High efficiency, rigid mini-pleat filters shall be 4” deep, totally rigid, and disposable type. Each filter shall consist of water-laid micro-fine fiberglass media formed with closely spaced pleats. The enclosing frame shall be double-walled water-resistant beverage board. The filter media shall have an average efficiency of 65% as rated by ASHRAE Standard 52.1 test methods. Filters shall be UL900 Class 2 listed.

2.10 DAMPERS

A. Mixing box and economizer outdoor air return air openings shall be airfoil low-leak dampers, Damper shall be parallel blade type. The frame shall be fabricated from 16-gauge galvanized steel. The damper shall meet the leakage requirements of ASHRAE Std. 90.1 and of the International Energy Conservation Code by leaking less than 3 CFM/sq. ft. at 1” of static pressure and shall be AMCA licensed as a Class 1A damper.

B. Mixing box and economizer outdoor air, return air openings shall be airfoil low-leak dampers. Damper shall be parallel blade type. Damper frame shall be 0.125” thick aluminum hat channel. Damper shall meet the leakage requirements of ASHRAE Std. 90.1 and of the International Energy Conservation Code by leaking less than 3 CFM/sq. ft. at 1” of static pressure, and shall be tested in accordance with AMCA Standard 500-D

2.11 ELECTRICAL POWER AND CONTROLS

A. Unit operating voltage shall 460V, 3 phase, 60Hz. All wiring and electrical equipment supplied by the manufacturer shall conform to and be installed in accordance with the requirements of UL1995.

Provide copper wires, bus bars, and fittings throughout, except the internal wire of the control transformer may be aluminum if copper termination is provided. Identify power supply terminals with permanent markers. The maximum temperature of terminals shall not exceed 167°F (75°C) when the equipment is tested in accordance with its rating. Wiring shall be run in plated flexible metal conduit.

B. Mount a permanent nameplate on the unit to display the manufacturer, serial number and model number, date of manufacture, horsepower, current rating, and voltage

2.12 UNIT TESTING AND QUALITY CONTROL

A. The fans shall be factory run tested to ensure design integrity and proper RPM. All electrical circuits shall be tested to ensure correct operation before shipment of unit. Units shall pass all quality control checks and be thoroughly cleaned prior to shipment.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Examine roughing-in for steam, hydronic, and condensate drainage piping systems and electrical services to verify actual locations of connections before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Concrete Bases: Install floor mounting units on 8-inch-high concrete bases. See Division 23 Section “Basic HVAC Materials and Methods” for concrete base materials and fabrication requirements.

B. Install modular indoor air-handling units with the following vibration-control devices. Vibration-control devices are specified in Division 23 Section "Mechanical Vibration and Seismic Controls."
   1. Units with Internally Isolated Fans: Secure units to anchor bolts installed in concrete bases.
   2. Floor-Mounted Units: Support on concrete bases using neoprene pads. Secure units to anchor bolts installed in concrete bases.
   3. Floor-Mounted Units: Support on concrete bases using housed-spring isolators. Secure units to anchor bolts installed in concrete bases.

C. Arrange installation of units to provide access space around modular indoor air-handling units for service and maintenance.

D. Equipment assembly to be supervised by a direct employee of the AHU manufacturer or by a manufacturer certified service organization. Provide supervision for as long a period of time as is necessary to ensure proper assembly or onsite training.

3.3 CONNECTIONS

A. Comply with requirements for piping specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to air-handling unit to allow service and maintenance.

C. Connect piping to modular indoor air-handling units mounted on vibration isolators with flexible connectors.

D. Connect condensate drain pans using NPS 1-1/4, Type M copper tubing. Extend to nearest equipment or floor drain. Construct deep trap at connection to drain pan and install cleanouts at changes in direction.

E. Chilled-Water Piping: Comply with applicable requirements in Division 23 Section "Hydronic Piping." Install shutoff valve and union or flange at each coil supply connection. Install balancing valve and union or flange at each coil return connection.

F. Duct installation and connection requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connections.

G. Electrical: Comply with applicable requirements in Division 26 Sections for power wiring, switches, and motor controls.

H. Ground equipment according to Division 26 Section “Grounding and Bonding.”

I. Tighten electrical connectors and terminals according to manufacturers’ published torque-tightening values. If manufacturers’ torque values are not indicated, use those specified in UL 486A and UL 486B.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installations, including piping and electrical connections.
   1. Leak Test: After installation, fill water and steam coils with water, and test coils and connections for leaks. Repair leaks and retest until no leaks exist.
   2. Charge refrigerant coils with refrigerant and test for leaks. Repair leaks and retest until no leaks exist.
   3. Fan Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation. Remove malfunctioning units, replace with new units, and retest.
   4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Prepare test and inspection reports in writing.

3.5 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

B. Final Checks before Start-Up:
   1. Verify that shipping, blocking, and bracing are removed.
   2. Verify that unit is secure on mountings and supporting devices and that connections to piping, ducts, and electrical systems are complete. Verify that proper thermal-overload protection is installed in motors, controllers, and switches.
   3. Perform cleaning and adjusting specified in this Section.
   4. Disconnect fan drive from motor, verify proper motor rotation direction, free fan wheel rotation, and smooth bearing operations. Reconnect fan drive system, align belts, and install belt guards.
   5. Verify that bearings, pulleys, belts, and other moving parts are lubricated with factory-recommended lubricants.
   6. Verify that outdoor- and return-air mixing dampers open and close and maintain minimum outdoor-air setting.
   7. Comb coil fins for parallel orientation.
   8. Verify that proper thermal-overload protection is installed for electric coils.
   9. Install new, clean filters.
   10. Verify that manual and automatic volume control and fire and smoke dampers in connected duct systems are in fully open position.

C. Starting procedures for modular indoor air-handling units include the following:
   1. Energize motor; verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated rpm. Replace fan and motor pulleys as required to achieve design conditions.
   2. Measure and record motor electrical values for voltage and amperage.
   3. Manually operate dampers from fully closed to fully open position and record fan performance.

3.6 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Comply with requirements in Division 23 Section "Testing, Adjusting, and Balancing" for air-handling system testing, adjusting, and balancing.

3.7 CLEANING

A. After completing system installation and testing, adjusting, and balancing modular indoor air-handling unit according to manufacturer's written instructions, clean internally to remove foreign material and construction dirt and dust. Clean fan wheels, cabinets, dampers, coils, and filter housings, and install new, clean filters.

3.8 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain modular indoor air-handling units. Refer to Division 01 Section "Closeout Procedures."

END OF SECTION 23 0725

SECTION 23 0738

MINI SPLIT-SYSTEM AIR-CONDITIONING UNITS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes mini split-system air-conditioning and heat pump units consisting of separate evaporator-fan and compressor-condenser components. Units are designed for exposed or concealed mounting and may be connected to ducts.

1.2 SUBMITTALS

A. Product Data: Include rated capacities, furnished specialties, and accessories for each type of product indicated. Include performance data in terms of capacities, outlet velocities, static pressures, sound power characteristics, motor requirements, and electrical characteristics.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For split-system air-conditioning units to include in emergency, operation, and maintenance manuals.

E. Warranty: Special warranty specified in this Section.

1.3 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of split-system units and are based on the specific system indicated. Refer to Division 01 Section "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Energy-Efficiency Ratio: Equal to or greater than prescribed by ASHRAE 90.1, "Energy Efficient Design of New Buildings except Low-Rise Residential Buildings."

D. Coefficient of Performance: Equal to or greater than prescribed by ASHRAE 90.1, "Energy Efficient Design of New Buildings except Low-Rise Residential Buildings."

E. Units shall be designed to operate with HCFC-free refrigerants.

1.4 COORDINATION

A. Coordinate size and location of concrete bases for units. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork are specified in Division 23 Section "Basic HVAC Materials and Methods."

B. Coordinate size, location, and connection details with roof curbs, equipment supports, and roof penetrations.

1.5 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of split-system air-conditioning units that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Carrier Air Conditioning; Div. of Carrier Corporation.
   2. Daikin.
   3. Fujitsu General American, Inc.
   4. LG.
   5. Mitsubishi Electronics America, Inc.; HVAC Division.
   6. Hitachi.
   7. Bryant.

2.2 WALL-MOUNTING, EVAPORATOR-FAN COMPONENTS

A. Cabinet: Enameled steel with removable panels on front and ends in color selected by Architect, and discharge drain pans with drain connection.

B. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins, complying with ARI 210/240, and with thermal-expansion valve.

C. Fan: Direct drive, centrifugal fan.

D. Fan Motors: Comply with requirements in Division 23 Section "Motors."
   1. Special Motor Features: Multitapped, multispeed with internal thermal protection and permanent lubrication.

E. Filters: Permanent, cleanable.

2.3 AIR-COOLED, COMPRESSOR-CONDENSER COMPONENTS

A. Casing: Steel, finished with baked enamel in color selected by Architect, with removable panels for access to controls, weep holes for water drainage, and mounting holes in base. Provide brass service valves, fittings, and gage ports on exterior of casing.

B. Compressor: Hermetically sealed with crankcase heater and mounted on vibration isolation. Compressor motor shall have thermal- and current-sensitive overload devices, start capacitor, relay, and contactor.
   1. Compressor Type: Scroll.
   2. Refrigerant Charge: R454B.

C. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins, complying with ARI 210/240, and with liquid subcooler.

D. Heat Pump Components: Reversing valve and low-temperature air cut-off thermostat.

E. Fan: Aluminum-propeller type, directly connected to motor.

F. Motor: Permanently lubricated, with integral thermal-overload protection.

G. Low Ambient Kit: Permits operation down to 10 deg F.

2.4 ACCESSORIES

A. Thermostat: Hard wired to remotely control compressor and evaporator fan, with the following features:
   1. 24-hour time control of system stop and start.
   2. Liquid-crystal display indicating temperature, set-point temperature, time setting, operating mode, and fan speed.
   3. Fan-speed selection, including auto setting.

B. Automatic-reset timer to prevent rapid cycling of compressor.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install units level and plumb.

B. Install evaporator-fan components using manufacturer's standard mounting devices securely fastened to building structure.

C. Install ground-mounting, compressor-condenser components on 4-inch- thick, reinforced concrete base; 4 inches larger on each side than unit. Concrete, reinforcement, and formwork are specified in Division 23 Section "Basic HVAC Materials and Methods" Coordinate anchor installation with concrete base.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to unit to allow service and maintenance.

C. Ground equipment per Division 26 Section "Grounding and Bonding."

D. Electrical Connections: Comply with requirements in Division 26 Sections for power wiring, switches, and motor controls.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.

B. Perform the following field tests and inspections and prepare test reports:
   1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
   2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
   3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Remove and replace malfunctioning units and retest as specified above.

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks per manufacturer's written instructions.

SECTION 23 0762

UNIT HEATERS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Wall and ceiling heaters with propeller fans and electric-resistance heating coils.

1.2 SUBMITTALS

A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for each product indicated.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   1. Drawings, elevations, sections, and details.
   2. Location and size of each field connection.
   3. Details of anchorages and attachments to structure and to supported equipment.
   4. Equipment schedules to include rated capacities, operating characteristics, furnished specialties, and accessories.
   5. Location and arrangement of piping valves and specialties.
   6. Location and arrangement of integral controls.
   7. Wiring Diagrams: Power, signal, and control wiring.

C. Coordination Drawings: Drawings, reflected ceiling drawings, and other details, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
   1. Suspended ceiling components.
   2. Structural members to which unit heaters will be attached.
   3. Method of attaching hangers to building structure.
   4. Size and location of initial access modules for acoustical tile.
   5. Items penetrating finished ceiling, including the following:
      a. Lighting fixtures.
      b. Air outlets and inlets.
      c. Speakers.
      d. Sprinklers.
      e. Access panels.
   6. Perimeter moldings for exposed or partially exposed cabinets.

D. Samples for Initial Selection: Finish colors for units with factory-applied color finishes.

E. Samples for Verification: Finish colors for each type of cabinet unit heater and wall and ceiling heaters indicated with factory-applied color finishes.

F. Field quality-control test reports.

G. Operation and Maintenance Data: For cabinet unit heaters to include in emergency, operation, and maintenance manuals.

1.3 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

PART 2 - PRODUCTS

2.1 WALL AND CEILING HEATERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawings or a comparable product by one of the following:
   1. Berko Electric Heating; a division of Marley Engineered Products.
   2. Chromalox, Inc.; a division of Emerson Electric Company.
   3. Indeeco.
   4. Markel Products; a division of TPI Corporation.
   5. Marley Electric Heating; a division of Marley Engineered Products.
   6. QMark Electric Heating; a division of Marley Engineered Products.
   7. Trane.

B. Description: An assembly including chassis, electric heating coil, fan, motor, and controls. Comply with UL 2021.

C. Cabinet:
   1. Front Panel: Stamped-steel louver, with removable panels fastened with tamperproof fasteners.
   2. Finish: Baked enamel over baked-on primer with manufacturer's standard color selected by Architect, applied to factory-assembled and -tested wall and ceiling heaters before shipping.

D. Surface-Mounting Cabinet Enclosure: Steel with finish to match cabinet.

E. Electric-Resistance Heating Coil: Nickel-chromium heating wire, free from expansion noise and hum, embedded in magnesium oxide refractory and sealed in corrosion-resistant metallic sheath. Terminate elements in stainless-steel, machine-staked terminals secured with stainless-steel hardware, and limit controls for high temperature protection. Provide integral circuit breaker for overcurrent protection.

F. Fan: Aluminum propeller directly connected to motor.
   1. Motor: Permanently lubricated, multispeed. Comply with requirements in Division 23 Section "Common Motor Requirements for HVAC Equipment."

G. Controls: Unit-mounted thermostat. Low-voltage relay with transformer kit.

H. Electrical Connection: Factory wire motors and controls for a single field connection with disconnect switch.

I. Capacities and Characteristics: See Equipment Schedules on Drawings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas to receive unit heaters for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Examine roughing-in for electrical connections to verify actual locations before unit heater installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install wall boxes in finished wall assembly, seal and weatherproof. Joint-sealant materials and applications are specified in Division 07 Section "Joint Sealants."

B. Install cabinet unit heaters to comply with NFPA 90A.

C. Install propeller unit heaters level and plumb.

D. Suspend unit heaters from structure with all-thread hanger rods and elastomeric hangers. Hanger rods and attachments to structure are specified in Division 23 Section "Hangers and Supports for HVAC Piping and Equipment."

E. Install wall-mounting thermostats and switch controls in electrical outlet boxes at heights to match lighting controls. Verify location of thermostats and other exposed control sensors with Drawings and room details before installation.

F. Install new filters in each fan-coil unit within two weeks of Substantial Completion.

3.3 CONNECTIONS

A. Ground equipment according to Division 26 Section "Grounding and Bonding."

B. Connect wiring according to Division 26 Section "Conductors and Cables."

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.

B. Perform the following field tests and inspections and prepare test reports:
   1. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
   2. Operate electric heating elements through each stage to verify proper operation and electrical connections.
   3. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.

C. Remove and replace malfunctioning units and retest as specified above.

3.5 ADJUSTING

A. Adjust initial temperature set points.

B. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to one visit to Project during other-than-normal occupancy hours for this purpose.

END OF SECTION 23 0762

SECTION 23 0775

ELECTRIC HEATING CABLES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following electric heating cables:
   1. Self-regulating, parallel resistance.

1.2 SUBMITTALS

A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for each type of product indicated.
   1. Schedule heating capacity, length of cable, spacing, and electrical power requirement for each electric heating cable required.

B. Shop Drawings: For electric heating cable. Include drawings, sections, details, and attachments to other work.
   1. Wiring Diagrams: Power, signal, and control wiring.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For electric heating cables to include in operation and maintenance manuals.

E. Warranty: Special warranty specified in this Section.

1.3 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.4 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace electric heating cable that fails in materials or workmanship within specified warranty period.
   1. Warranty Period: 1 year from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SELF-REGULATING, PARALLEL-RESISTANCE HEATING CABLES

A. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawings or a comparable product by one of the following:
   1. Chromalox, Inc.; Wiegard Industrial Division; Emerson Electric Company.
   2. Delta-Therm Corporation.
   3. Easy Heat Inc.
   4. Nelson Heat Trace.
   5. Pyrotenax; a division of Tyco Thermal Controls.
   6. Raychem; a division of Tyco Thermal Controls.
   7. Thermon Manufacturing Co.

B. Heating Element: Pair of parallel No. 16 AWG tinned stranded copper bus wires embedded in crosslinked conductive polymer core, which varies heat output in response to temperature along its length. Terminate with waterproof, factory-assembled nonheating leads with connectors at one end

and seal the opposite end watertight. Cable shall be capable of crossing over itself once without overheating.

C. Electrical Insulating Jacket: Flame-retardant polyolefin.

D. Cable Cover: Tinned-copper or Stainless-steel braid, and polyolefin outer jacket with UV inhibitor.

E. Maximum Operating Temperature (Power On): 150 deg F

F. Maximum Exposure Temperature (Power Off): 185 deg F.

G. Capacities and Characteristics:
1. Maximum Heat Output: 5 W/ft.
2. Volts: 120V.
3. Phase: 1.
4. Hertz: 60.

2.2 CONTROLS

A. Refer to Division 23 Sections "HVAC Instrumentation and Controls."

B. Pipe-Mounting Thermostats for Freeze Protection:
1. Remote bulb unit with adjustable temperature range from 30 to 50 deg F.
2. Snap action: open-on-rise, single-pole switch with minimum current rating adequate for connected cable.
3. Remote bulb on capillary, resistance temperature device, or thermistor for directly sensing pipe-wall temperature.
4. Corrosion-resistant, waterproof control enclosure.

2.3 ACCESSORIES

A. Cable Installation Accessories: Fiberglass tape, heat-conductive putty, cable ties, silicone end seals and splice kits, and installation clips all furnished by manufacturer, or as recommended in writing by manufacturer.

B. Warning Labels: Refer to Division 23 Section "Mechanical Identification."

C. Warning Tape: Continuously printed "Electrical Tracing"; vinyl, at least 3 mils thick, and with pressure-sensitive, permanent, waterproof, self-adhesive back.
1. Width for Markers on Pipes with OD, Including Insulation, Less Than 6 Inches: 3/4 inch minimum.
2. Width for Markers on Pipes with OD, Including Insulation, 6 Inches or Larger: 1-1/2 inches minimum.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine surfaces and substrates to receive electric heating cables for compliance with requirements for installation tolerances and other conditions affecting performance.
1. Ensure surfaces and pipes in contact with electric heating cables are free of burrs and sharp protrusions.
2. Ensure surfaces and substrates are level and plumb.
3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATIONS

A. Install the following types of electric heating cable for the applications described:
1. Freeze Protection for Outdoor Pipe: Self-regulating, parallel-resistance heating cable.

3.3 INSTALLATION

A. Install electric heating cable or mats across expansion, construction, and control joints according to manufacturer's written recommendations using cable protection conduit and slack cable to allow movement without damage to cable.

B. Electric Heating Cable Installation for Freeze Protection for Piping:
   1. Install electric heating cables after piping has been tested and before insulation is installed.
   2. Install electric heating cables according to IEEE 515.1.
   3. Install insulation over piping with electric cables according to Division 23 Section "Mechanical Insulation."
   4. Install warning tape on piping insulation where piping is equipped with electric heating cables.

C. Set field-adjustable switches and circuit-breaker trip ranges.

D. Protect installed heating cables, including nonheating leads, from damage.

3.4 CONNECTIONS

A. Ground equipment according to Division 26 Section "Grounding and Bonding."

B. Connect wiring according to Division 26 Section "Conductors and Cables."

3.5 FIELD QUALITY CONTROL

A. Testing: Perform tests after cable installation but before application of coverings such as insulation, wall or ceiling construction, or concrete.
   1. Test cables for electrical continuity and insulation integrity before energizing.
   2. Test cables to verify rating and power input. Energize and measure voltage and current simultaneously.

B. Remove and replace malfunctioning units and retest as specified above.

END OF SECTION 23 0775

SECTION 23 0820

DUCT ACCESSORIES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
1. Backdraft dampers.
2. Barometric and pressure relief dampers.
3. Manual volume dampers.
4. Control dampers.
5. Flange connectors.
6. Turning vanes.
7. Duct-mounted access doors.
8. Flexible connectors.
9. Flexible ducts.
10. Duct accessory hardware.

1.2 SUBMITTALS

A. Product Data: For each type of product included in this section.
1. For duct silencers, include pressure drop and dynamic insertion loss data. Include breakout noise calculations for high transmission loss casings.

B. Shop Drawings: For duct accessories. Include drawings, elevations, sections, details, and attachments to other work.
1. Detail duct accessories fabrication and installation in ducts and other construction. Include dimensions, weights, loads, and required clearances, and method of field assembly into duct systems and other construction. Include the following:
a. Special fittings.
b. Manual volume damper installations.
c. Control damper installations.
d. Fire-damper, smoke-damper, combination fire- and smoke-damper, ceiling, and corridor damper installations, including sleeves; and duct-mounted access doors and remote damper operators.
e. Duct security bars.
f. Wiring Diagrams: For power, signal, and control wiring.

C. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which ceiling-mounted access panels and access doors required for access to duct accessories are shown and coordinated with each other, using input from Installers of the items involved.

D. Operation and Maintenance Data: For air duct accessories to be included in operation and maintenance manuals.

1.3 QUALITY ASSURANCE

A. Comply with NFPA 90A, "Installation of Air Conditioning and Ventilating Systems," and with NFPA 90B, "Installation of Warm Air Heating and Air Conditioning Systems."

B. Comply with AMCA 500-D testing for damper rating.

1.4 COORDINATION

A. Coordinate size, quantity, type, and locations of automatic dampers with Division 23, Section "HVAC Instrumentation and Controls."

PART 2 - PRODUCTS

2.1 MATERIALS

A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

B. Galvanized Sheet Steel: Comply with ASTM A 653/A 653M.
   1. Galvanized Coating Designation: G90.
   2. Exposed-Surface Finish: Mill phosphatized.

C. Aluminum Sheets: Comply with ASTM B 209, Alloy 3003, Temper H14; with mill finish for concealed ducts and standard, 1-side bright finish for exposed ducts.

D. Extruded Aluminum: Comply with ASTM B 221, Alloy 6063, Temper T6.

E. Reinforcement Shapes and Plates: Galvanized-steel reinforcement where installed on galvanized sheet metal ducts; compatible materials for aluminum and stainless-steel ducts.

F. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

G. Galvanized dampers specified below: Use equivalent stainless-steel dampers in stainless steel ducts and aluminum dampers in aluminum ducts constructed per SMACNA standards.

2.2 BACKDRAFT DAMPERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Air Balance Inc.; a division of Mestek, Inc.
   2. American Warming and Ventilating; a division of Mestek, Inc.
   3. Cesco Products; a division of Mestek, Inc.
   4. Duro Dyne Inc.
   5. Greenheck Fan Corporation.
   6. Nailor Industries Inc.
   7. NCA Manufacturing, Inc.
   8. Ruskin Company.
   9. SEMCO Incorporated.
   10. Vent Products Company, Inc.

B. Description: Gravity balanced.

C. Maximum Air Velocity: 3000 fpm.

D. Maximum System Pressure: 2-inch wg.

E. Frame: 0.125-inch-thick extruded aluminum, with welded corners and mounting flange.

F. Blades: Multiple single-piece blades, maximum 6-inch width, 0.070-inch- thick, extruded aluminum with sealed edges.

G. Blade Action: Parallel.

H. Blade Seals: Extruded vinyl, mechanically locked.

I. Blade Axles:
   1. Material: Metallic.
   2. Diameter: 0.75 inch.

J. Tie Bars and Brackets: Galvanized steel.

K. Bearings: Synthetic sleeve type.

L. Sleeve: Minimum 20-gauge thickness.

2.3 BAROMETRIC RELIEF DAMPERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Air Balance Inc.; a division of Mestek, Inc.
   2. American Warming and Ventilating; a division of Mestek, Inc.
   3. Cesco Products; a division of Mestek, Inc.
   4. Duro Dyne Inc.
   5. Greenheck Fan Corporation.
   6. Lloyd Industries, Inc.
   7. Nailor Industries Inc.
   8. NCA Manufacturing, Inc.
   9. Pottorff; a division of PCI Industries, Inc.
   10. Ruskin Company.
   11. SEMCO Incorporated.
   12. Vent Products Company, Inc.

B. Suitable for horizontal or vertical mounting.

C. Maximum Air Velocity: 2000 fpm.

D. Maximum System Pressure: 2-inch wg.

E. Frame: 0.064-inch thick, galvanized sheet steel, with welded corners and mounting flange.

F. Blades:
   1. Multiple, 0.025-inch-thick, roll-formed aluminum.
   2. Maximum Width: 6 inches.
   3. Action: Parallel.
   4. Balance: Gravity.
   5. Eccentrically pivoted.

G. Blade Seals: Vinyl.

H. Blade Axles: Nonferrous metal.

I. Tie Bars and Brackets:
   1. Material: Galvanized steel**.**
   2. Rattle free with 90-degree stop.

J. Return Spring: Adjustable tension.

K. Bearings: Synthetic.

L. Accessories:
   1. Flange on intake.
   2. Adjustment device to permit setting for varying differential static pressures.

2.4 MANUAL VOLUME DAMPERS - STANDARD

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Air Balance Inc.; a division of Mestek, Inc.
   2. American Warming and Ventilating; a division of Mestek, Inc.
   3. Greenheck: MBD-10, MBD-15, MBDR-50.
   4. McGill AirFlow LLC.
   5. METALAIRE, Inc.
   6. Nailor Industries Inc.
   7. Ruskin Company: MD-25, MD-35, MDRS-25.
   8. Vent Products Company, Inc.

B. Standard leakage rating, with linkage concealed in frame.

C. Suitable for horizontal or vertical applications.

D. Galvanized dampers specified below: Use equivalent stainless-steel dampers in stainless steel ducts and aluminum dampers in aluminum ducts constructed per SMACNA standards.

E. Dampers up to 36x12 inches with a maximum velocity of 1500 fpm (457m/min)
   1. Basis of Design: Ruskin MD25.
   2. Frames:
      a. Hat-shaped, galvanized steel channels, 22-gauge minimum thickness.
      b. Mitered and welded corners.
      c. Flangeless frames for installing in ducts.
   3. Blades:
      a. Single blade.
      b. Stiffen damper blades for stability.
      c. Galvanized steel, 22 gauge thick.
   4. Blade Axles: Galvanized steel.
   5. Bearings:
      a. Molded synthetic.
   6. Tie Bars and Brackets: Galvanized steel.
   7. Actuator: Locking hand quadrant with ½ inch round or 3/8-inch square shaft.

F. Dampers up to 48x48 inches with maximum velocity = 1500 fpm.
   1. Basis of Design: Ruskin MD35.
   2. Frames:
      a. Hat-shaped, galvanized steel channels, 20-gauge minimum thickness.
      b. Mitered and welded corners.
      c. Flangeless frames for installing in ducts.
   3. Blades:
      a. Multiple blade.
      b. Opposed-blade design.
      c. Stiffen damper blades for stability.
      d. Galvanized steel 16 gauge thick.
   4. Blade Axles: Galvanized steel.
   5. Linkage: Concealed in frame.
   6. Bearings:
      a. Molded synthetic.
   7. Tie Bars and Brackets: Galvanized steel.
   8. Actuator: Locking hand quadrant for ½ inch round shaft.

G. Dampers up to 16-inch diameter with a maximum velocity of 1500 fpm
   1. Basis of Design: Ruskin MDRS25.
   2. Frames:
      a. Galvanized steel, 20-gauge minimum thickness.
      b. Roll formed with stiffener beads each end.
      c. Flangeless frames for installing in ducts.
   3. Blades:
      a. Butterfly type.
      b. Stiffen damper blades for stability.
      c. Galvanized steel 20 gauge thick.
   4. Blade Axles: Galvanized steel.
   5. Bearings:
      a. Molded synthetic.
   6. Actuator: Locking hand quadrant for ½ inch round or 3/8 inch for square shaft.

H. Accessories:
   1. Hand Quadrant Standoff Bracket: 2-inch standoff for externally insulated ductwork.

2.5 CONTROL DAMPERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. American Warming and Ventilating; a division of Mestek, Inc.
   2. Arrow United Industries; a division of Mestek, Inc.
   3. Cesco Products; a division of Mestek, Inc.
   4. Duro Dyne Inc.
   5. Greenheck Fan Corporation.
   6. Nailor Industries Inc.
   7. NCA Manufacturing, Inc.
   8. Ruskin Company.
   9. Vent Products Company, Inc.
   10. Young Regulator Company.

B. Low-leakage rating and bearing AMCA's Certified Ratings Seal for both air performance and air leakage.

C. Frames:
   1. Hat shaped.
   2. Extruded aluminum channels, 0.064 inch thick.
   3. Mitered and welded corners.

D. Blades:
   1. Multiple blade with maximum blade width of 8 inches.
   2. Parallel- and opposed-blade design.
   3. Extruded aluminum.
   4. 0.064 inch thick.
   5. Blade Edging: Closed-cell neoprene edging.

E. Blade Axles: 1/2-inch- diameter; nonferrous metal; blade-linkage hardware of zinc-plated steel and brass; ends sealed against blade bearings.
   1. Operating Temperature Range: From minus 40 to plus 200 deg F.

F. Bearings:
   1. Molded synthetic.

2. Dampers in ducts with pressure classes of 3-inch wg or less shall have axles full length of damper blades and bearings at both ends of operating shaft.
3. Thrust bearings at each end of every blade.

2.6 FLANGE CONNECTORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Ductmate Industries, Inc.
2. Nexus PDQ; Division of Shilco Holdings Inc.
3. Ruskin Company.
4. Ward Industries, Inc.; a division of Hart & Cooley, Inc.

B. Description: Add-on or roll-formed, factory-fabricated, slide-on transverse flange connectors, gaskets, and components.

C. Material: Galvanized steel.

D. Gauge and Shape: Match connecting ductwork.

2.7 TURNING VANES

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Ductmate Industries, Inc.
2. Duro Dyne Inc.
3. METALAIRE, Inc.
4. SEMCO Incorporated.
5. Ward Industries, Inc.; a division of Hart & Cooley, Inc.

B. Turning Vanes for Metal Ducts: Curved blades of galvanized sheet steel; support with bars perpendicular to blades set; set into vane runners suitable for duct mounting.

C. General Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 2-3, "Vanes and Vane Runners," and 2-4, "Vane Support in Elbows."

D. Vane Construction: Single wall for ducts up to 18 inches high or maximum velocity of 1500 fpm and double wall for larger dimensions or velocities and all medium pressure supply duct.

2.8 DUCT-MOUNTED ACCESS DOORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Cesco Products; a division of Mestek, Inc.
2. Ductmate Industries, Inc.
3. Flexmaster U.S.A., Inc.
4. Greenheck Fan Corporation.
5. McGill AirFlow LLC.
6. Nailor Industries Inc.
7. Pottorff; a division of PCI Industries, Inc.
8. Ventfabrics, Inc.
9. Ward Industries, Inc.; a division of Hart & Cooley, Inc.

B. Duct-Mounted Access Doors: Fabricate access panels according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 2-10, "Duct Access Doors and Panels," and 2-11, "Access Panels - Round Duct."
1. Door:
   a. Double wall.
   b. Galvanized sheet metal with 1-inch-thick insulation fill.

c. Latches: Cam latches – plated steel with galvanized steel strikes.
2. Frame: Galvanized sheet steel, with bend-over tabs and foam gaskets.
3. Number of Latches:
a. Access Doors Less Than 12 Inches Square: Two sash latches.
b. Access Doors 12-18 Inches Square: Four sash latches.

C. Round Duct Access Door:
1. Basis of Design: Ruskin ADR.
2. Door:
a. Oval shape, double skin.
b. Galvanized steel with poly-insulation; 22 gauge for 10x6 inch door size; 20 gauge for 16x12 inch door size.
c. Latches: Compression with two hand knobs.
d. Seal: Insert neoprene gasket.
3. Leakage: Airtight to 20-inch W.G.

2.9 FLEXIBLE CONNECTORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Ductmate Industries, Inc.
2. Duro Dyne Inc.
3. Ventfabrics, Inc.
4. Ward Industries, Inc.; a division of Hart & Cooley, Inc.

B. Materials: Flame-retardant or noncombustible fabrics.

C. Coatings and Adhesives: Comply with UL 181, Class 1.

D. Metal-Edged Connectors: Factory fabricated with a fabric strip 3-1/2 inches wide attached to 2 strips of 2-3/4-inch- wide, 0.028-inch- thick, galvanized sheet steel or 0.032-inch- thick aluminum sheets. Provide metal compatible with connected ducts.

E. Indoor System, Flexible Connector Fabric: Glass fabric double coated with neoprene.
1. Minimum Weight: 26 oz./sq. yd.
2. Tensile Strength: 480 lbf/inch in the wrap and 360 lbf/inch in the filling.
3. Service Temperature: Minus 40 to plus 200 deg F.

F. Electrical Grounding
1. Install braided copper jumpers around all flexible connectors.

2.10 FLEXIBLE DUCTS

A. Insulated Flexible Duct, Low Pressure: Installed Downstream of Air Terminal Units and Low-Pressure AC Units.
1. Manufacturers:
a. Atco Rubber Products; 30 Series.
b. Flexmaster: Type 5 (Basis of Design).
c. Thermaflex: M-KE.
2. UL 181, Class 1, trilaminate of aluminum foil, fiberglass, and aluminized polyester mechanically locked (no adhesives) to a helically wound galvanized steel wire, fiberglass insulation, black polyethylene vapor-barrier.
3. Vapor Barrier Permeance: 0.1 perm per ASTM E96, procedure A.
4. Pressure rating: 6-inch WG positive and 4-inch WG through 16-inch diameter.
5. Temperature Range: Minus 20 to plus 210 deg F.
6. Thermal Performance: R-value not less than 4.2 per ASTM C-518.

B. Insulated Flexible Ducts, Medium Pressure: Located Upstream of Air Terminal Units.
   1. Manufacturers:
      a. Atco Rubber Products; OMNI Air 1200.
      b. Flexmaster: Type 4 (Basis of Design).
      c. Technaflex: 57K.
      d. Thermaflex: M-KC.
   2. UL 181, Class 1, heavy coated fiberglass cloth mechanically locked (no adhesives) to a helically wound galvanized steel wire, fiberglass insulation, black polyethylene vapor-barrier.
   3. Vapor Barrier Permeance: 0.1 perm ASTM E96, procedure A.
   4. Pressure rating: 12inch WG positive and 5-inch WG through 16-inch diameter.
   5. Temperature Range: Minus 20 to plus 210 deg F.
   6. Thermal Performance: R-value not less than 4.2 per ASTM C-518.

C. Insulated Flexible Duct located in vented attic, unvented attic above the envelope insulation or in a non-conditioned space.
   1. Flexible ducts same as specified above except with a Thermal Performance R-Value not less than 6.0 per ASTM C-518 shall be provided for:
      a. All flexible duct located in the attic.
      b. All flexible duct located in the space above the ceiling at the roof level.

D. Spin-Ins: Branch Duct Connectors for Connecting Round Low Pressure Duct to Rectangular Low-Pressure Duct:
   1. Manufactures:
      a. Flexmaster: FLD (Basis of Design)
   2. Galvanized steel G-90 minimum 26 gauge.

E. Side Takeoff Fitting: Rectangular Inlet with Round Outlet for Connecting Round Low Pressure Duct to Rectangular Low-Pressure Duct.
   1. Manufacturers:
      a. Flexmaster: STOD/B03. (Basis of Design)
   2. Galvanized steel, G-90 minimum 26 gauge.

F. Flexible Duct Clamps: Make Connections Between Flexible and Other Duct or Equipment with Duct Clamps:
   1. High and Medium Pressure (Upstream of Air Terminal Units): Stainless steel band with cadmium plated hex screw to tighten band with a worm gear action and duct sealer.
   2. Low Pressure: Nylon strap, above accessible ceilings. Provide stainless steel band with cadmium plated hex screw to tighten band with a worm gear action above inaccessible ceilings. Use stainless steel band above non-accessible ceilings.

G. Connect Air Terminal Units to supply ducts with maximum 12-inch lengths of flexible duct. Do not use flexible ducts to change directions.

H. Connect diffusers to low-pressure ducts directly or with maximum 60-inch lengths of flexible duct clamped or strapped in place.

2.11 DUCT ACCESSORY HARDWARE

A. Instrument Test Holes: Cast iron or cast aluminum to suit duct material, including screw cap and gasket. Size to allow insertion of pitot tube and other testing instruments and of length to suit duct-insulation thickness.

B. Adhesives: High strength, quick setting, neoprene based, waterproof, and resistant to gasoline and grease.

PART 3 - EXECUTION

3.1 INSTALLATION - GENERAL

A. Install duct accessories according to applicable details in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for metal ducts.

B. Install duct accessories of materials suited to duct materials; use galvanized-steel accessories in galvanized-steel and fibrous-glass ducts, stainless-steel accessories in stainless-steel ducts, and aluminum accessories in aluminum ducts.

C. Install duct test holes where required for testing and balancing purposes.

3.2 DAMPERS

A. Install backdraft dampers at inlet of exhaust fans or exhaust ducts as close as possible to exhaust fan unless otherwise indicated.

B. Install volume dampers at points on supply, return, and exhaust systems where branches extend from larger ducts. Where dampers are installed in ducts having duct liner, install dampers with hat channels of same depth as liner, and terminate liner with nosing at hat channel.
   1. Install steel volume dampers in steel ducts.
   2. Install aluminum volume dampers in aluminum ducts.

C. Set dampers to fully open position before testing, adjusting, and balancing. Saw mark end of shaft parallel with damper blade.

D. Connect ducts to sound attenuators rigidly.

3.3 DUCT ACCESS DOORS

A. Install duct access doors on sides of ducts to allow for inspecting, adjusting, and maintaining accessories and equipment at the following locations:
   1. On both sides of duct coils.
   2. Downstream from control dampers.
   3. Upstream of air flow monitors (AFM).
   4. Elsewhere as indicated.

B. Access Door Sizes:
   1. One-Hand or Inspection Access: 8 by 5 inches.
   2. Two-Hand Access: 12 by 6 inches.
   3. Head and Hand Access: 18 by 10 inches.
   4. Head and Shoulders Access: 21 by 14 inches.

C. Label access doors according to Division 23 Section "Identification for HVAC Piping and Equipment" to indicate the purpose of access door.

3.4 FLEXIBLE CONNECTORS

A. Install flexible connectors at all duct connections to all fans and AC units.

B. Install flexible connectors in all ducts at building expansion joints.

C. Electrical Grounding: Install braided copper jumpers around all flexible connections, taking care that jumpers do not bind flexes.

3.5 FIELD QUALITY CONTROL

A. Tests and Inspections:
   1. Operate dampers to verify full range of movement.

2. Inspect locations of access doors and verify that purpose of access door can be performed.
3. Inspect turning vanes for proper and secure installation.

END OF SECTION 23 0820

SECTION 23 0838

POWER VENTILATORS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:
   1. In-line centrifugal fans.

1.2 PERFORMANCE REQUIREMENTS

A. Project Altitude: Base air ratings on project site conditions.

B. Operating Limits: Classify according to AMCA 99.

1.3 SUBMITTALS

A. Product Data: Include rated capacities, furnished specialties, and accessories for each type of product indicated and include the following:
   1. Certified fan performance curves with system operating conditions indicated.
   2. Certified fan sound-power ratings.
   3. Motor ratings and electrical characteristics, plus motor and electrical accessories.
   4. Material gages and finishes, including color charts.
   5. Dampers, including housings, linkages, and operators.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   1. Wiring Diagrams: Power, signal, and control wiring. Differentiate between manufacturer-installed and field-installed wiring.

C. Maintenance Data: For power ventilators to include in maintenance manuals specified in Division 01.

1.4 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. NEMA Compliance: Motors and electrical accessories shall comply with NEMA standards.

C. UL Standard: Power ventilators shall comply with UL 705.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver fans as factory-assembled unit, to the extent allowable by shipping limitations, with protective crating and covering.

B. Disassemble and reassemble units, as required for moving to final location, according to manufacturer's written instructions.

C. Lift and support units with manufacturer's designated lifting or supporting points.

1.6 SOURCE QUALITY CONTROL

A. Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Factory test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Label fans with the AMCA-Certified Ratings Seal.

B. Fan Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings according to AMCA 210, "Laboratory Methods of Testing Fans for Rating." Label fans with the AMCA – Certified Rating Seal.

1.7 COORDINATION

A. Coordinate size and location of structural-steel support members.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Basis of Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:

2.2 IN-LINE CENTRIFUGAL FANS

A. Manufacturer:
   1. Barry Blower Div./Penn Ventilation Companies, Inc.
   2. Cook, Loren Company.
   3. Greenheck Fan Corp.

B. Description: In-line, direct driven centrifugal fans; as scheduled on the Drawings, consisting of housing, wheel, outlet guide vanes, fan shaft, bearings, motor and disconnect switch, drive assembly, mounting brackets, and accessories.

C. Housing: Split, spun aluminum with aluminum straightening vanes, inlet and outlet flanges, and support bracket adaptable to floor, side wall, or ceiling mounting.

D. Direct-Driven Units: Motor encased in housing outside of airstream, factory wired to disconnect switch located on outside of fan housing.

E. Fan Wheels: Aluminum, airfoil blades welded to aluminum hub.

F. Accessories: Provide per fan equipment schedule on Drawings.
   1. Volume-Control Damper: Manually operated with quadrant lock, located in fan outlet.
   2. Companion Flanges: For inlet and outlet duct connections.
   3. Fan Guards: 1/2- by 1-inch mesh of galvanized steel in removable frame. Provide guard for inlet or outlet for units not connected to ductwork.

2.3 MOTORS

A. Comply with requirements in Division 23 Section "Common Motor Requirements for HVAC Equipment."

B. Enclosure Type: Guarded drip proof.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install power ventilators level and plumb.

B. Support suspended units from structure using threaded steel rods and spring hangers. Vibration-control devices are specified in Division 23 Section "Mechanical Vibration Controls and Seismic Restraints."

C. Install units with clearances for service and maintenance.

D. Label units according to requirements specified in Division 23 Section "Identification for HVAC Piping and Equipment."

3.2 CONNECTIONS

A. Duct installation and connection requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Flexible connectors are specified in Division 23 Section "Duct Accessories."

B. Install ducts adjacent to power ventilators to allow service and maintenance.

C. Ground equipment.

D. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.3 FIELD QUALITY CONTROL

A. Equipment Startup Checks:
   1. Verify that shipping, blocking, and bracing are removed.
   2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
   3. Verify that cleaning and adjusting are complete.
   4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
   5. Verify lubrication for bearings and other moving parts.
   6. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
   7. Disable automatic temperature-control operators.

B. Starting Procedures:
   1. Energize motor and adjust fan to indicated rpm.
   2. Measure and record motor voltage and amperage.

C. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation. Remove malfunctioning units, replace with new units, and retest.

D. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

E. Shut unit down and reconnect automatic temperature-control operators.

F. Refer to Division 23 Section "Testing, Adjusting, and Balancing" for testing, adjusting, and balancing procedures.

G. Repair or replace malfunctioning units. Retest as specified above after repairs or replacements are made.

3.4 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Lubricate bearings.

3.5 CLEANING

A. On completion of installation, internally clean fans according to manufacturer's written instructions. Remove foreign material and construction debris. Vacuum fan wheel and cabinet.

B. After completing system installation, including outlet fitting and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finishes.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain power ventilators.
   1. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining equipment and schedules.
   2. Review data in maintenance manuals. Refer to Division 01 Section "Closeout Procedures" or "Operations and Maintenance Data."
   3. Schedule training with Owner, through Architect, with at least seven days' advance notice.

END OF SECTION 23 0838

SECTION 23 0840

AIR TERMINAL UNITS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:
   1. Single-duct air terminal units.

1.2 SUBMITTALS

A. Product Data: For each type of product indicated, include rated capacities, furnished specialties, sound-power ratings, and accessories.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, required clearances, method of field assembly, components, and location and size of each field connection.
   1. Include a schedule showing unique model designation, model number, size, left or right-hand casing configuration for piping connections and controls access.

C. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
   1. Ceiling suspension assembly members.
   2. Size and location of initial access modules for acoustical tile.
   3. Ceiling-mounted items including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.

D. Operation and Maintenance Data: For air terminal units to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Closeout Procedures or Operation and Maintenance Data," include the following:
   1. Instructions for calibrating air flow volumes.

1.3 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of air terminal units and are based on the specific system indicated. Refer to Division 01 Section "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. NFPA Compliance: Install air terminal units according to NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems."

1.4 COORDINATION

A. Coordinate layout and installation of air terminal units and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, HVAC and plumbing system piping, fire-suppression system, and partition assemblies.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 SHUTOFF SINGLE-DUCT AIR TERMINAL UNITS

A. Manufacturers:
1. Environmental Technologies, Inc.; Enviro-Air Div.
2. Price Industries.
3. Titus.
4. Trane.

B. Configuration: Volume-damper assembly inside unit casing with control components located inside a protective metal shroud.

C. Casing: 22-gauge galvanized steel.
1. Casing Lining: Adhesive attached, 3/8-inch- thick, closed cell foam insulation complying with UL 181 erosion requirements and having a maximum flame-spread index of 25 and a maximum smoke-developed index of 50, for both insulation and adhesive, when tested according to ASTM E 84.
2. Air Inlet: Round stub connection or S-slip and drive connections for duct attachment.
3. Air Outlet: S-slip and drive connections.
4. Access: Removable panels for access to hot water coil or electric heating element, adjustment, or maintenance; with airtight gasket.

D. Volume Damper: Galvanized steel with peripheral gasket, self-lubricating bearings, cast in damper position indicator and mechanical stop to prevent over stroking.
1. Maximum Damper Leakage: ARI 880 rated, 1 percent of nominal airflow at 4-inch wg inlet static pressure.
2. Damper Position: See Control Sequence on Drawings.

E. Attenuator Section: 22-gauge galvanized steel.
1. Lining: Same as box casing lining above.

F. Electric Heating Coil: Slip-in-type, open-coil design with integral control box factory wired and installed. Include the following features:
1. Automatic-reset primary and manual-reset secondary overtemperature protection.
2. Nickel chrome 80/20 heating elements.
3. Airflow switch (differential pressure).
4. Door interlock disconnect switch.
5. Fuses (for coils more than 48 A).
6. Magnetic contactor for each step of control.

G. DDC Controls: Single-package unitary controller and actuator specified in Division 23 Section "HVAC Instrumentation and Controls."
1. The air terminal units shall be equipped with pressure independent direct digital controls supplied by the control contractor and factory mounted by the terminal unit manufacturer. Control contractor shall provide data sheets on all components to be mounted, indicating component dimensions, mounting hardware, and methods, as well as wiring and piping diagrams for each application identified by unit tag per schedule in the drawings to the terminal manufacturer. Control Contractor shall be responsible for cost to ship controls to terminal unit manufacturer’s factory.
2. Controls shall be compatible with pneumatic inlet velocity sensors supplied by the terminal manufacturer. The sensor shall be multi-port center averaging type, with a minimum of four measuring ports, in series are not acceptable. The sensor must provide a minimum differential pressure signal of 0.03" wg. at an inlet velocity of 500 fpm.
3. Controls shall be field set by control contractor for the scheduled minimum and maximum flow rates. Flow measuring taps and flow curves will be supplied with each terminal for field

balancing airflow. All pneumatic tubing shall be UL listed fire retardant (FR) type. Each terminal shall be equipped with labeling showing unit location, size, and scheduled cfm.

4. Terminal manufacturer to provide a Class 2, 24-volt control transformer and disconnect switch.
5. All controls shall be installed in approved NEMA type sheet metal enclosure provided by terminal manufacturer.
6. Control enclosure and wiring shall meet UL listing and labeling requirements of the Local Building Official.
7. If controls are field mounted, air terminal manufacturer shall provide a UL labeled control enclosure and additionally provide disconnect switch and control transformer for air terminals with a fan or electric heat.

2.3 SOURCE QUALITY CONTROL

A. Identification: Label each air terminal unit with plan number, nominal airflow, maximum and minimum factory-set airflows, coil type, and ARI certification seal.

B. Verification of Performance: Rate air terminal units according to ARI 880.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install air terminal units level and plumb. Maintain sufficient clearance for normal service and maintenance.

3.2 CONNECTIONS

A. Connect ducts to air terminal units according to Division 23 Section "Metal Ducts."

B. Ground units with electric heating coils according to Division 26.

C. Connect wiring according to Division 26 Section.

3.3 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:
1. After installing air terminal units and after electrical circuitry has been energized, test for compliance with requirements.
2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Remove and replace malfunctioning units and retest as specified above.

3.4 STARTUP SERVICE

A. Complete installation and startup checks according to manufacturer's written instructions and do the following:
1. Verify that inlet duct connections are as recommended by air terminal unit manufacturer to achieve proper performance.
2. Verify that controls and control enclosure are accessible.
3. Verify that control connections are complete.
4. Verify that nameplate and identification tag are visible.
5. Verify that controls respond to inputs as specified.

3.5 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain air terminal units. Refer to Division 01 Section "Closeout Procedures or Demonstration and Training."

END OF SECTION 23 0840

SECTION 23 0855

AIR OUTLETS AND INLETS

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Diffusers.

B. Registers / Grilles.

C. Weather Louvers.

1.2 SUBMITTALS

A. Submit under provisions of Section 230010.

B. Product Data: Provide data for equipment required for this project. Review outlets and inlets as to size, finish, and type of mounting prior to submission. Submit schedule of outlets and inlets showing type, size, location, application, and noise level.

1.3 QUALITY ASSURANCE

A. Test and rate air outlet and inlet performance in accordance with ADC Equipment Test Code 062 and ASHRAE 70.

B. Test and rate louver performance in accordance with AMCA 500.

PART 2 - PRODUCTS

2.1 GRILLES, REGISTERS AND DIFFUSERS - GENERAL

A. Acceptable Manufacturer's:
1. Titus.
2. Metal Air.
3. Kreuger.
4. Carnes.
5. Price.
6. Tuttle & Bailey.

B. Coordinate / verify border and frame types for ceiling air devices are shown on Architectural Reflective Ceiling Plan.

C. Equip all ceiling mounted air devices with ceiling radiation dampers and thermal blankets.

2.2 SQUARE PLAQUE CEILING DIFFUSERS (ACD)

A. Manufacturer's:
1. Titus Model OMNI: Steel construction.

B. Type: Square plaque stamped diffuser to discharge air in 360 pattern as scheduled with round neck.

C. Neck sizes as shown on drawings, held in place by four hooks; foil backed insulation.

D. Fabrication: Steel with baked white anodic acrylic paint finish.

E. Accessories: Manual damper.

2.3 LINEAR SLOT DIFFUSER (LSD)

A. Manufacturer:
1. Titus, Model TBDI-80.

B. Type: Continuous, 1-inch-wide slot, number of slots wide as scheduled, with adjustable vanes for left, right or vertical discharge; integral ceiling fire damper.

C. Fabrication: Steel with factory baked enamel finish. Exposed surfaces black. T-bar white.

D. Plenum: Integral, galvanized steel, insulated.

E. Accessories: T-bar one side with mounting clip-on opposite side.

2.4 WALL SUPPLY REGISTERS (SR)

A. Manufacturers:
1. Titus Model 300F.

B. Type: Individually adjustable blades, 3/4-inch minimum depth, 3/4-inch maximum spacing with friction pivots to set blades, vertical face, double deflection.

C. Frame: 1-1/4 inch margin with countersunk screw mounting and gasket.

D. Fabrication: Aluminum with factory white baked anodic acrylic paint finish.

E. Damper: Integral, gang-operated opposed blade type operable from face.

2.5 CEILING EGGCRATE EXHAUST, RETURN AND TRANSFER REGISTERS/GRILLES (E,R,T)

A. Manufacturers:
1. Titus Model 50F.

B. Type: Fixed grilles of 1/2 x 1/2-inch eggcrate.

C. Border:
1. Neck sizes up to 12x12 inch, 1-1/4 inch margin with countersunk screw mounting, with plaster frame.
2. Neck size 14x14 inch and larger, lay in frame.

D. Fabrication: All aluminum with factory white anodic acrylic finish. Provide steel border when scheduled to be equipped with ceiling radiation damper.

E. Damper: Integral, gang-operated, opposed blade type operable from face. Omit damper on transfer grilles (T) and non-ducted return grilles.

2.6 WEATHER LOUVERS

A. Weather Louvers specified under Division 08.

B. Manufacturers:
1. Greenheck Model ESD-603.
2. Other acceptable manufacturers offering equivalent products.
   a. Ruskin.
   b. Airolite.
   c. Construction Specialties.

C. Type: 6 inch deep with stationary blades on 45-degree slope with integral gutter on each jamb shall incorporate an integral downspout, heavy channel frame.

D. Fabrication: 12-gauge thick extruded aluminum, welded assembly, with factory 3 coat Kynar 500 fluoropolymer spray finish, factory standard color to be selected.

E. Mounting: Furnish with exterior masonry strap anchors for installation.

F. Accessories: Removable, rear mounted, 1/2" mesh aluminum birdscreen; extended sill finished to match louver.

G. Performance: 4'x4' unit: Free area = 8.53 sq.ft. (53%); at an intake 1,250 FPM free area velocity static pressure drop not exceeding 0.26" water gauge and water penetration not exceeding 0.01 ounces of water per sq.ft.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Check location of outlet and inlets and make necessary adjustments in position to conform with architectural features, symmetry, and lighting arrangements.

C. Install diffusers to ductwork with airtight connection.

D. Provide balancing dampers on duct take-off to diffusers, and grilles and registers, despite whether dampers are specified as part of the diffuser, or grille and register assembly.

E. Paint ductwork visible behind air outlets and inlets matte black. Refer to Section 099100.

F. Ceiling mounted air devices connected with flexible duct shall be secured to prevent falling if grid shifts.

G. Weather Louvers: Blank unused portion of louvers with sandwich of 1 inch duct liner with 26-gauge galvanized steel inner and outer panels. Fasten blanks to indoor side of louvers with sheet metal screws and seal with duct sealer.

END OF SECTION 23 0855

This page intentionally left blank

SECTION 23 0900

HVAC INSTRUMENTATION AND CONTROLS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes control equipment for HVAC systems and components, including control components for terminal heating and cooling units not supplied with factory-wired controls.

1.2 DEFINITIONS

A. DDC: Direct digital control.

B. I/O: Input/output.

C. MS/TP: Master slave/token passing.

D. PC: Personal computer.

E. PID: Proportional plus integral plus derivative.

F. RTD: Resistance temperature detector.

1.3 SYSTEM PERFORMANCE

A. Comply with the following performance requirements:
   1. Graphic Display: Display graphic with minimum 20 dynamic points with current data within 10 seconds.
   2. Graphic Refresh: Update graphic with minimum 20 dynamic points with current data within 8 seconds.
   3. Object Command: Reaction time of less than two seconds between operator command of a binary object and device reaction.
   4. Object Scan: Transmit change of state and change of analog values to control units or workstation within six seconds.
   5. Alarm Response Time: Annunciate alarm at workstation within 45 seconds. Multiple workstations must receive alarms within five seconds of each other.
   6. Program Execution Frequency: Run capability of applications as often as five seconds but selected consistent with mechanical process under control.
   7. Performance: Programmable controllers shall execute DDC PID control loops, and scan and update process values and outputs at least once per second.
   8. Reporting Accuracy and Stability of Control: Report values and maintain measured variables within tolerances as follows:
      a. Water Temperature: Plus or minus 1 deg F.
      b. Water Flow: Plus or minus 5 percent of full scale.
      c. Water Pressure: Plus or minus 2 percent of full scale.
      d. Space Temperature: Plus or minus 1 deg F.
      e. Ducted Air Temperature: Plus or minus 1 deg F.
      f. Outside Air Temperature: Plus or minus 2 deg F.
      g. Dew Point Temperature: Plus or minus 3 deg F.
      h. Temperature Differential: Plus or minus 0.25 deg F.
      i. Relative Humidity: Plus or minus 5 percent.
      j. Airflow (Pressurized Spaces): Plus or minus 3 percent of full scale.
      k. Airflow (Measuring Stations): Plus or minus 5 percent of full scale.
      l. Airflow (Terminal): Plus or minus 10 percent of full scale.

m. Air Pressure (Ducts): Plus or minus 0.1-inch wg.
n. Carbon Monoxide: Plus or minus 5 percent of reading.
o. Carbon Dioxide: Plus or minus 50 ppm.
p. Electrical: Plus or minus 5 percent of reading.

1.4 SEQUENCE OF OPERATION

A. Control diagrams on drawings are intended to indicate, in general, control arrangements. Provide all instruments, relays, operators, switches, etc. required to accomplish control sequences whether or not such devices are actually shown on control diagrams.

1.5 SUBMITTALS

A. Product Data: Include manufacturer's technical literature for each control device. Indicate dimensions, capacities, performance characteristics, electrical characteristics, finishes for DDC System Hardware: Bill of materials of equipment indicating quantity, manufacturer, and model number. Include technical data for operator workstation equipment, interface equipment, control units, transducers/transmitters, sensors, actuators, valves, relays/switches, control panels, and operator interface equipment.
2. Control System Software: Include technical data for operating system software, operator interface, color graphics, and other third-party applications.
3. Controlled Systems: Instrumentation list with element name, type of device, manufacturer, model number, and product data. Include written description of sequence of operation including schematic diagram.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
1. Bill of materials of equipment indicating quantity, manufacturer, and model number.
2. Schematic flow diagrams showing fans, pumps, coils, dampers, valves, and control devices.
3. Wiring Diagrams: Power, signal, and control wiring.
4. Details of control panel faces, including controls, instruments, and labeling.
5. Written description of sequence of operation.
6. Schedule of dampers including size, leakage, and flow characteristics.
7. Schedule of valves including flow characteristics.
8. DDC System Hardware:
a. Wiring diagrams for control units with termination numbers.
b. Schematic diagrams and drawings for field sensors and control hardware.
c. Schematic diagrams for control, communication, and power wiring, showing trunk data conductors and wiring between operator workstation and control unit locations.
9. Control System Software: List of color graphics indicating monitored systems, data (connected and calculated) point addresses, output schedule, and operator notations.
10. Controlled Systems:
a. Schematic diagrams of each controlled system with control points labeled and control elements graphically shown, with wiring.
b. Scaled drawings showing mounting, routing, and wiring of elements including bases and special construction.
c. Written description of sequence of operation including schematic diagram.
d. Points list.

C. Data Communications Protocol Certificates: Certify that each proposed DDC system component complies with ASHRAE 135.

D. Samples for Initial Selection: For each color required, of each type of thermostat or sensor cover with factory-applied color finishes.

E. Samples for Verification: For each color required, of each type of thermostat or sensor cover.

F. Software and Firmware Operational Documentation: Include the following:
1. Software operating and upgrade manuals.
2. Program Software Backup: On a magnetic media or compact disc, complete with data files.
3. Device address list.
4. Printout of software application and graphic screens.
5. Software license required by and installed for DDC workstations and control systems.

G. Software Upgrade Kit: For Owner to use in modifying software to suit future systems revisions or monitoring and control revisions.

H. Qualification Data: For installer.

I. Field quality-control test reports.

J. Operation and Maintenance Data: For HVAC instrumentation and control system to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:
1. Maintenance instructions and lists of spare parts for each type of control device and compressed-air station.
2. Interconnection wiring diagrams with identified and numbered system components and devices.
3. Keyboard illustrations and step-by-step procedures indexed for each operator function.
4. Inspection period, cleaning methods, cleaning materials recommended, and calibration tolerances.
5. Calibration records and list of set points.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Automatic control system manufacturer's authorized representative who is trained and approved for installation of system components required for this Project.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with ASHRAE 135 for DDC system components.

1.7 DELIVERY, STORAGE, AND HANDLING

A. System Software: Update to latest version of software at Project completion.

1.8 COORDINATION

A. Coordinate location of thermostats, humidistats, and other exposed control sensors with drawings and room details before installation.

B. Coordinate equipment with Division 28 Section "Intrusion Detection" to achieve compatibility with equipment that interfaces with that system and with building master clock.

C. Coordinate equipment with Division 28 Section "Security Access" to achieve compatibility with equipment that interfaces with that system.

D. Coordinate equipment with Division 28 Section "Clock and Program Control" to achieve compatibility with equipment that interfaces with that system.

E. Coordinate equipment with Division 28 Section "Detention Monitoring and Control (PLC Based)" to achieve compatibility with equipment that interfaces with that system.

F. Coordinate equipment with Division 28 Section "Lighting Controls" to achieve compatibility with equipment that interfaces with that system.

G. Coordinate equipment with Division 28 Section "Fire Alarm" to achieve compatibility with equipment that interfaces with that system.

H. Coordinate supply of conditioned electrical branch circuits for control units and operator workstation.

I. Coordinate equipment with Division 26 Section "Electrical Power Monitoring and Control" to achieve compatibility of communication interfaces.

J. Coordinate equipment with Division 26 Section "Panelboards" to achieve compatibility with starter coils and annunciation devices.

K. Coordinate equipment with Division 26 Section "Motor-Control Centers" to achieve compatibility with motor starters and annunciation devices.

L. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03 Section "Cast-in-Place Concrete."

1.9 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Replacement Materials: One replacement diaphragm or relay mechanism for each unique positioning relay.
   2. Maintenance Materials: One thermostat adjusting key(s).

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include but are not limited to, manufacturers specified.
   2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 CONTROL SYSTEM

A. Available Manufacturers:
   1. Trane; Worldwide Applied Systems Group
   2. Automated Logic Corporation.
   3. Honeywell International Inc.; Home & Building Control.
   4. Johnson Controls, Inc.; Controls Group.
   5. KMC Controls/Kreuter Manufacturing Company.
   6. Siemens Building Technologies, Inc.
   7. STC Worldwide.

B. Control system shall consist of sensors, indicators, actuators, final control elements, interface equipment, other apparatus, accessories, and software connected to distributed controllers operating in multiuser, multitasking environment on token-passing network and programmed to control mechanical systems. An operator workstation permits interface with the network via dynamic color graphics with each mechanical system, building floor plan, and control device depicted by point-and-click graphics.

C. Control system shall include the following:
1. Building intrusion detection system specified in Division 28 Section "Intrusion Detection."
2. Building clock control system specified in Division 28 Section "Clock and Program Control."
3. Building lighting control system specified in Division 28 Section "Lighting Controls."
4. Fire alarm system specified in Division 28 Section "Fire Alarm."

2.3 DDC EQUIPMENT

A. Operator Workstation: One PC-based microcomputer(s) with minimum configuration as follows:
1. Motherboard: With 8 integrated USB 2.0 ports, integrated Intel Pro 10/100 (Ethernet), integrated audio, bios, and hardware monitoring.
2. Processor: Intel Pentium 11
3. Random-Access Memory: 64 GB.
4. Graphics: Video adapter, minimum 1600 x 1200 pixels, 64 MB video memory, with TV out.
5. Monitor: 24 inches, LCD color.
6. Keyboard: QWERTY, 105 keys in ergonomic shape.
7. Hard-Disk Drive: 500 GB .
8. Mouse: Three button, optical.
9. Uninterruptible Power Supply: 350 kVa.
10. Operating System: Microsoft Windows 10 with high-speed Internet access.
    a. ASHRAE 135 Compliance: Workstation shall use ASHRAE 135 protocol and communicate using ISO 8802-3 (Ethernet) datalink/physical layer protocol.
11. Printer: Color, ink-jet type as follows:
    a. Print Head: 4800 x 1200 dpi optimized color resolution.
    b. Paper Handling: Minimum of 100sheets.
    c. Print Speed: Minimum of 17ppm in black and 12ppm in color.
12. Application Software:
    a. I/O capability from operator station.
    b. System security for each operator via software password and access levels.
    c. Automatic system diagnostics; monitor system and report failures.
    d. Database creation and support.
    e. Automatic and manual database save and restore.
    f. Dynamic color graphic displays with up to 10 screen displays at once.
    g. Custom graphics generation and graphics library of HVAC equipment and symbols.
    h. Alarm processing, messages, and reactions.
    i. Trend logs retrievable in spreadsheets and database programs.
    j. Alarm and event processing.
    k. Object and property status and control.
    l. Automatic restart of field equipment on restoration of power.
    m. Data collection, reports, and logs. Include standard reports for the following:
        1) Current values of all objects.
        2) Current alarm summary.
        3) Disabled objects.
        4) Alarm lockout objects.
        5) Logs.
    n. Custom report development.
    o. Utility and weather reports.
    p. ASHRAE Guideline 3 report.
    q. Workstation application editors for controllers and schedules.
    r. Maintenance management.

13. Custom Application Software:
    a. English language oriented.
    b. Full-screen character editor/programming environment.
    c. Allow development of independently executing program modules with debugging/simulation capability.
    d. Support conditional statements.
    e. Support floating-point arithmetic with mathematical functions.
    f. Contains predefined time variables.

B. Diagnostic Terminal Unit: Portable notebook-style, PC-based microcomputer terminal capable of accessing system data by connecting to system network with minimum configuration as follows:
1. System: With one integrated USB 2.0 port, integrated Intel Pro 10/100 (Ethernet), integrated audio, bios, and hardware monitoring.
2. Processor: Intel Pentium 11
3. Random-Access Memory: 64GB.
4. Graphics: Video adapter, minimum 1024 x 768 pixels, 64 MB video memory.
5. Monitor: 17 inches, LCD color.
6. Keyboard: QWERTY 105 keys in ergonomic shape.
7. Hard-Disk Drive: 500 GB.
8. Pointing Device: Touch pad or other internal device.

C. Control Units: Modular, comprising processor board with programmable, nonvolatile, random-access memory; local operator access and display panel; integral interface equipment; and backup power source.
1. Units monitor or control each I/O point; process information; execute commands from other control units, devices, and operator stations; and download from or upload to operator workstation or diagnostic terminal unit.
2. Stand-alone mode control functions operate regardless of network status. Functions include the following:
    a. Global communications.
    b. Discrete/digital, analog, and pulse I/O.
    c. Monitoring, controlling, or addressing data points.
    d. Software applications, scheduling, and alarm processing.
    e. Testing and developing control algorithms without disrupting field hardware and controlled environment.
3. Standard Application Programs:
    a. Electric Control Programs: Demand limiting, duty cycling, automatic time scheduling, start/stop time optimization, night setback/setup, on-off control with differential sequencing, staggered start, anti-short cycling, PID control, DDC with fine tuning, and trend logging.
    b. HVAC Control Programs: Optimal run time, supply-air reset, and enthalpy switchover.
    c. Chiller Control Programs: Control function of condenser-water reset, chilled-water reset, and equipment sequencing.
    d. Programming Application Features: Include trend point; alarm processing and messaging; weekly, monthly, and annual scheduling; energy calculations; run-time totalization; and security access.
    e. Remote communications.
    f. Maintenance management.
    g. Units of Measure: Inch-pound and SI (metric).
4. Local operator interface provides for download from or upload to operator workstation or diagnostic terminal unit.

5. ASHRAE 135 Compliance: Control units shall use ASHRAE 135 protocol and communicate using ISO 8802-3 (Ethernet) datalink/physical layer protocol.

D. Local Control Units: Modular, comprising processor board with electronically programmable, nonvolatile, read-only memory; and backup power source.
1. Units monitor or control each I/O point, process information, and download from or upload to operator workstation or diagnostic terminal unit.
2. Stand-alone mode control functions operate regardless of network status. Functions include the following:
   a. Global communications.
   b. Discrete/digital, analog, and pulse I/O.
   c. Monitoring, controlling, or addressing data points.
3. Local operator interface provides for download from or upload to operator workstation or diagnostic terminal unit.
4. ASHRAE 135 Compliance: Control units shall use ASHRAE 135 protocol and communicate using ISO 8802-3 (Ethernet) datalink/physical layer protocol.

E. I/O Interface: Hardwired inputs and outputs may tie into system through controllers. Protect points so that shorting will cause no damage to controllers.
1. Binary Inputs: Allow monitoring of on-off signals without external power.
2. Pulse Accumulation Inputs: Accept up to 10 pulses per second.
3. Analog Inputs: Allow monitoring of low-voltage (0- to 10-V dc), current (4 to 20 mA), or resistance signals.
4. Binary Outputs: Provide on-off or pulsed low-voltage signal, selectable for normally open or normally closed operation with three-position (on-off-auto) override switches and status lights.
5. Analog Outputs: Provide modulating signal, either low voltage (0- to 10-V dc) or current (4 to 20 mA) with status lights, two-position (auto-manual) switch, and manually adjustable potentiometer.
6. Tri-State Outputs: Provide two coordinated binary outputs for control of three-point, floating-type electronic actuators.
7. Universal I/Os: Provide software selectable binary or analog outputs.

F. Power Supplies: Transformers with Class 2 current-limiting type or overcurrent protection; limit connected loads to 80 percent of rated capacity. DC power supply shall match output current and voltage requirements and be full-wave rectifier type with the following:
1. Output ripple of 5.0 mV maximum peak to peak.
2. Combined 1 percent line and load regulation with 100-mic.sec. response time for 50 percent load changes.
3. Built-in overvoltage and overcurrent protection and be able to withstand 150 percent overload for at least 3 seconds without failure.

G. Power Line Filtering: Internal or external transient voltage and surge suppression for workstations or controllers with the following:
1. Minimum dielectric strength of 1000 V.
2. Maximum response time of 10 nanoseconds.
3. Minimum transverse-mode noise attenuation of 65 dB.
4. Minimum common-mode noise attenuation of 150 dB at 40 to 100 Hz.

2.4 UNITARY CONTROLLERS

A. Unitized, capable of stand-alone operation with sufficient memory to support its operating system, database, and programming requirements, and with sufficient I/O capacity for the application.

1. Configuration: Local keypad and display; diagnostic LEDs for power, communication, and processor; wiring termination to terminal strip or card connected with ribbon cable; memory with bios; and 72-hour battery backup.
2. Operating System: Manage I/O communication to allow distributed controllers to share real and virtual object information and allow central monitoring and alarms. Perform scheduling with real-time clock. Perform automatic system diagnostics; monitor system and report failures.
3. ASHRAE 135 Compliance: Communicate using read (execute and initiate) and write (execute and initiate) property services defined in ASHRAE 135. Reside on network using MS/TP datalink/physical layer protocol and have service communication port for connection to diagnostic terminal unit.
4. Indoor enclosure: Dustproof rated for operation at 32 to 120 deg F.
5. Outdoor enclosure: Waterproof rated for operation at 40 to 150 deg F.

2.5 ALARM PANELS

A. Unitized cabinet with suitable brackets for wall or floor mounting. Fabricate of 0.06-inch- thick furniture-quality steel or extruded-aluminum alloy, totally enclosed, with hinged doors and keyed lock and with manufacturer's standard shop-painted finish. Provide common keying for all panels.

B. Indicating light for each alarm point, single horn, acknowledge switch, and test switch, mounted on hinged cover.
1. Alarm Condition: Indicating light flashes and horn sounds.
2. Acknowledge Switch: Horn is silent and indicating light is steady.
3. Second Alarm: Horn sounds and indicating light is steady.
4. Alarm Condition Cleared: System is reset and indicating light is extinguished.
5. Contacts in alarm panel allow remote monitoring by independent alarm company.

2.6 ANALOG CONTROLLERS

A. Step Controllers: 6- or 10-stage type, with heavy-duty switching rated to handle loads and operated by electric motor.

B. Electric, Outdoor-Reset Controllers: Remote-bulb or bimetal rod-and-tube type, proportioning action with adjustable throttling range, adjustable set point, scale range minus 10 to plus 70 deg F, and single- or double-pole contacts.

C. Electronic Controllers: Wheatstone-bridge-amplifier type, in steel enclosure with provision for remote-resistance readjustment. Identify adjustments on controllers, including proportional band and authority.
1. Single controllers can be integral with control motor if provided with accessible control readjustment potentiometer.

D. Fan-Speed Controllers: Solid-state model providing field-adjustable proportional control of motor speed from maximum to minimum of 55 percent and on-off action below minimum fan speed. Controller shall briefly apply full voltage, when motor is started, to rapidly bring motor up to minimum speed. Equip with filtered circuit to eliminate radio interference.

E. Receiver Controllers: Single- or multiple-input models with control-point adjustment, direct or reverse acting with mechanical set-point adjustment with locking device, proportional band adjustment, authority adjustment, and proportional control mode.
1. Remote-control-point adjustment shall be plus or minus 20 percent of sensor span, input signal of 3 to 13 psig.
2. Proportional band shall extend from 2 to 20 percent for 5 psig.
3. Authority shall be 20 to 200 percent.

4. Air-supply pressure of 18 psig, input signal of 3 to 15 psig, and output signal of zero to supply pressure.
5. Gages: 3-1/2 inches in diameter, 2.5 percent wide-scale accuracy, and range to match transmitter input or output pressure.

2.7 TIME CLOCKS

A. Available Manufacturers:
1. ATC-Diversified Electronics.
2. Grasslin Controls Corporation.
3. Paragon Electric Co., Inc.
4. Precision Multiple Controls, Inc.
5. SSAC Inc.; ABB USA.
6. TCS/Basys Controls.
7. Theben AG - Lumilite Control Technology, Inc.
8. Time Mark Corporation.

B. Solid-state, programmable time control with 4 separate programs each with up to 100 on-off operations; 1-second resolution; lithium battery backup; keyboard interface and manual override; individual on-off-auto switches for each program; 365-day calendar with 20 programmable holidays; choice of fail-safe operation for each program; system fault alarm; and communications package allowing networking of time controls and programming from PC.

2.8 ELECTRONIC SENSORS

A. Description: Vibration and corrosion resistant; for wall, immersion, or duct mounting as required.

B. Thermistor Temperature Sensors and Transmitters:
1. Available Manufacturers:
   a. BEC Controls Corporation.
   b. Ebtron, Inc.
   c. Heat-Timer Corporation.
   d. I.T.M. Instruments Inc.
   e. MAMAC Systems, Inc.
   f. RDF Corporation.
2. Accuracy: Plus or minus 0.5 deg F at calibration point.
3. Wire: Twisted, shielded-pair cable.
4. Insertion Elements in Ducts: Single point, 8 inches long; use where not affected by temperature stratification or where ducts are smaller than 9 sq. ft.
5. Averaging Elements in Ducts: 36 inches long, flexible; use where prone to temperature stratification or where ducts are larger than 10 sq. ft.
6. Insertion Elements for Liquids: Brass or stainless-steel socket with minimum insertion length of 2-1/2 inches.
7. Room Sensor Cover Construction: Manufacturer's standard locking covers.
8. Outside-Air Sensors: Watertight inlet fitting, shielded from direct sunlight.
9. Room Security Sensors: Stainless-steel cover plate with insulated back and security screws.

C. RTDs and Transmitters:
1. Accuracy: Plus or minus 0.2 percent at calibration point.
2. Wire: Twisted, shielded-pair cable.
3. Insertion Elements in Ducts: Single point, 8 inches long; use where not affected by temperature stratification or where ducts are smaller than 9 sq. ft.

4. Averaging Elements in Ducts: 18 inches long, rigid; use where prone to temperature stratification or where ducts are larger than 9 sq. ft.; length as required.
5. Insertion Elements for Liquids: Brass socket with minimum insertion length of 2-1/2 inches.
6. Room Sensor Cover Construction: Manufacturer's standard locking covers.
7. Outside-Air Sensors: Watertight inlet fitting, shielded from direct sunlight.
8. Room Security Sensors: Stainless-steel cover plate with insulated back and security screws.

D. Humidity Sensors: Bulk polymer sensor element.
1. Accuracy: 2 percent full range with linear output.
2. Room Sensor Range: 20 to 80 percent relative humidity.
3. Room Sensor Cover Construction: Manufacturer's standard locking covers.
4. Duct Sensor: 20 to 80 percent relative humidity range with element guard and mounting plate.
5. Outside-Air Sensor: 20 to 80 percent relative humidity range with mounting enclosure, suitable for operation at outdoor temperatures of minus 22 to plus 185 deg F.
6. Duct and Sensors: With element guard and mounting plate, range of 0 to 100 percent relative humidity.

E. Pressure Transmitters/Transducers:
1. Static-Pressure Transmitter: Nondirectional sensor with suitable range for expected input, and temperature compensated.
a. Accuracy: 2 percent of full scale with repeatability of 0.5 percent.
b. Output: 4 to 20 mA.
c. Building Static-Pressure Range: 0- to 0.25-inch wg.
d. Duct Static-Pressure Range: 0- to 5-inch wg.
2. Water Pressure Transducers: Stainless-steel diaphragm construction, suitable for service; minimum 150-psig operating pressure; linear output 4 to 20 mA.
3. Water Differential-Pressure Transducers: Stainless-steel diaphragm construction, suitable for service; minimum 150-psig operating pressure and tested to 300-psig; linear output 4 to 20 mA.
4. Differential-Pressure Switch (Air or Water): Snap acting, with pilot-duty rating and with suitable scale range and differential.
5. Pressure Transmitters: Direct acting for gas, liquid, or steam service; range suitable for system; linear output 4 to 20 mA.

F. Room Sensor Cover Construction: Manufacturer's standard locking covers.

G. Room sensor accessories include the following:
1. Insulating Bases: For sensors located on exterior walls.
2. Guards: Locking; heavy-duty, transparent plastic; mounted on separate base
3. Adjusting Key: As required for calibration and cover screws.

2.9 STATUS SENSORS

A. Status Inputs for Fans: Differential-pressure switch with pilot-duty rating and with adjustable range of 0- to 5-inch wg.

B. Status Inputs for Electric Motors: Comply with ISA 50.00.01, current-sensing fixed- or split-core transformers with self-powered transmitter, adjustable and suitable for 175 percent of rated motor current.

C. Voltage Transmitter (100- to 600-V ac): Comply with ISA 50.00.01, single-loop, self-powered transmitter, adjustable, with suitable range and 1 percent full-scale accuracy.

D. Power Monitor: 3-phase type with disconnect/shorting switch assembly, listed voltage, and current transformers, with pulse kilowatt hour output and 4- to 20-mA kW output, with maximum 2 percent error at 1.0 power factor and 2.5 percent error at 0.5 power factor.

E. Current Switches: Self-powered, solid-state with adjustable trip current, selected to match current and system output requirements.

F. Electronic Valve/Damper Position Indicator: Visual scale indicating percent of travel and 2- to 10-V dc, feedback signal.

2.10 GAS DETECTION EQUIPMENT

A. Available Manufacturers:
1. B. W. Technologies.
2. CEA Instruments, Inc.
3. Ebtron, Inc.
4. Gems Sensors Inc.
5. Greystone Energy Systems Inc.
6. Honeywell International Inc.; Home & Building Control.
7. INTEC Controls, Inc.
8. I.T.M. Instruments Inc.

B. Occupancy Sensor: Passive infrared, with time delay, daylight sensor lockout, sensitivity control, and 180-degree field of view with vertical sensing adjustment; for flush mounting.

2.11 FLOW MEASURING STATIONS

A. Duct Airflow Station: Combination of air straightener and multiport, self-averaging pitot tube station.
1. Available Manufacturers:
   a. Air Monitor Corporation.
   b. Ebtron.
2. Casing: Galvanized steel frame.
3. Flow Straightener: Aluminum honeycomb, 3/4-inch parallel cell, 3 inches deep.
4. Sensing Manifold: Copper manifold with bullet-nosed static pressure sensors positioned on equal area basis.

2.12 THERMOSTATS

A. Combination Thermostat and Fan Switches: Line-voltage thermostat with push-button or lever-operated fan switch.
1. Label switches “FAN ON-OFF".
2. Mount on single electric switch box.

B. Electric, solid-state, microcomputer-based room thermostat with remote sensor.
1. Automatic switching from heating to cooling.
2. Preferential rate control to minimize overshoot and deviation from set point.
3. Set up for four separate temperatures per day.
4. Instant override of set point for continuous or timed period from 1 hour to 31 days.
5. Short-cycle protection.
6. Programming based on weekday, Saturday, and Sunday.
7. Selection features include degree F or degree C display, 12- or 24-hour clock, keyboard disable, remote sensor, and fan on-auto.
8. Battery replacement without program loss.
9. Thermostat display features include the following:
   a. Time of day.
   b. Actual room temperature.
   c. Programmed temperature.

d. Programmed time.
e. Duration of timed override.
f. Day of week.
g. System mode indications include "heating," "off," "fan auto," and "fan on."

C. Low-Voltage, On-Off Thermostats: NEMA DC 3, 24-V, bimetal-operated, mercury-switch type, with adjustable or fixed anticipation heater, concealed set-point adjustment, 55 to 85 deg F set-point range, and 2 deg F maximum differential.

D. Line-Voltage, On-Off Thermostats: Bimetal-actuated, open contact or bellows-actuated, enclosed, snap-switch or equivalent solid-state type, with heat anticipator; listed for electrical rating; with concealed set-point adjustment, 55 to 85 deg F set-point range, and 2 deg F maximum differential.
1. Electric Heating Thermostats: Equip with off position on dial wired to break ungrounded conductors.
2. Selector Switch: Integral, manual on-off-auto.

E. Remote-Bulb Thermostats: On-off or modulating type, liquid filled to compensate for changes in ambient temperature; with copper capillary and bulb, unless otherwise indicated.
1. Bulbs in water lines with separate wells of same material as bulb.
2. Bulbs in air ducts with flanges and shields.
3. Averaging Elements: Copper tubing with either single- or multiple-unit elements, extended to cover full width of duct or unit; adequately supported.
4. Scale settings and differential settings are clearly visible and adjustable from front of instrument.
5. On-Off Thermostat: With precision snap switches and with electrical ratings required by application.
6. Modulating Thermostats: Construct so complete potentiometer coil and wiper assembly is removable for inspection or replacement without disturbing calibration of instrument.

F. Fire-Protection Thermostats: Listed and labeled by an NRTL acceptable to authorities having jurisdiction; with fixed or adjustable settings to operate at not less than 75 deg F above normal maximum operating temperature, and the following:
1. Reset: Manual.

G. Immersion Thermostat: Remote-bulb or bimetal rod-and-tube type, proportioning action with adjustable throttling range and adjustable set point.

H. Airstream Thermostats: Two-pipe, fully proportional, single-temperature type; with adjustable set point in middle of range, adjustable throttling range, plug-in test fitting or permanent pressure gage, remote bulb, bimetal rod and tube, or averaging element.

I. Electric, Low-Limit Duct Thermostat: Snap-acting, single-pole, single-throw, manual- or automatic-reset switch that trips if temperature sensed across any 12 inches of bulb length is equal to or below set point.
1. Bulb Length: Minimum 20 feet.
2. Quantity: One thermostat for every 20 sq. ft. of coil surface.

J. Electric, High-Limit Duct Thermostat: Snap-acting, single-pole, single-throw, manual- or automatic-reset switch that trips if temperature sensed across any 12 inches of bulb length is equal to or above set point.
1. Bulb Length: Minimum 20 feet.
2. Quantity: One thermostat for every 20 sq. ft. of coil surface.

K. Heating/Cooling Valve-Top Thermostats: Proportional acting for proportional flow, with molded-rubber diaphragm, remote-bulb liquid-filled element, direct and reverse acting at minimum shutoff pressure of 25 psig and cast housing with position indicator and adjusting knob.

2.13 HUMIDISTATS

A. Duct-Mounting Humidistats: Electric insertion, 2-position type with adjustable, 2 percent throttling range, 20 to 80 percent operating range, and single- or double-pole contacts.

2.14 ACTUATORS

A. Electric Motors: Size to operate with sufficient reserve power to provide smooth modulating action or two-position action.
   1. Comply with requirements in Division 23 Section "Motors."
   2. Permanent Split-Capacitor or Shaded-Pole Type: Gear trains completely oil immersed and sealed. Equip spring-return motors with integral spiral-spring mechanism in housings designed for easy removal for service or adjustment of limit switches, auxiliary switches, or feedback potentiometer.
   3. Nonspring-Return Motors for Valves Larger Than NPS 2-1/2: Size for running torque of 150 in. x lbf and breakaway torque of 300 in. x lbf.
   4. Spring-Return Motors for Valves Larger Than NPS 2-1/2: Size for running and breakaway torque of 150 in. x lbf.
   5. Nonspring-Return Motors for Dampers Larger Than 25 Sq. Ft.: Size for running torque of 150 in. x lbf and breakaway torque of 300 in. x lbf.
   6. Spring-Return Motors for Dampers Larger Than 25 Sq. Ft.: Size for running and breakaway torque of 150 in. x lbf.

B. Electronic Actuators: Direct-coupled type designed for minimum 60,000 full-stroke cycles at rated torque.
   1. Valves: Size for torque required for valve close off at maximum pump differential pressure.
   2. Dampers: Size for running torque calculated as follows:
      a. Parallel-Blade Damper with Edge Seals: 7 inch-lb/sq. ft. of damper.
      b. Opposed-Blade Damper with Edge Seals: 5 inch-lb/sq. ft. of damper.
      c. Parallel-Blade Damper without Edge Seals: 4 inch-lb/sq. ft of damper.
      d. Opposed-Blade Damper without Edge Seals: 3 inch-lb/sq. ft. of damper.
      e. Dampers with 2- to 3-Inch wg of Pressure Drop or Face Velocities of 1000 to 2500 fpm: Increase running torque by 1.5.
      f. Dampers with 3- to 4-Inch wg of Pressure Drop or Face Velocities of 2500 to 3000 fpm: Increase running torque by 2.0.
   3. Coupling: V-bolt and V-shaped, toothed cradle.
   4. Overload Protection: Electronic overload or digital rotation-sensing circuitry.
   5. Fail-Safe Operation: Mechanical, spring-return mechanism. Provide external, manual gear release on nonspring-return actuators.
   6. Power Requirements (Two-Position Spring Return): 24-V ac.
   7. Power Requirements (Modulating): Maximum 10 VA at 24-V ac or 8 W at 24-V dc.
   8. Proportional Signal: 2- to 10-V dc or 4 to 20 mA, and 2- to 10-V dc position feedback signal.
   9. Temperature Rating: Minus 22 to plus 122 deg F.
   10. Temperature Rating (Smoke Dampers): Minus 22 to plus 250 deg F.
   11. Run Time: 12 seconds open, 5 seconds closed.

2.15 DAMPERS

A. Dampers: AMCA-rated, opposed-blade design; 0.108-inch- minimum thick, galvanized-steel or 0.125-inch- minimum thick, extruded-aluminum frames with holes for duct mounting; damper blades

shall not be less than 0.064-inch- thick galvanized steel with maximum blade width of 8 inches and length of 48 inches.

1. Secure blades to 1/2-inch- diameter, zinc-plated axles using zinc-plated hardware, with nylon blade bearings, blade-linkage hardware of zinc-plated steel and brass, ends sealed against spring-stainless-steel blade bearings, and thrust bearings at each end of every blade.
2. Operating Temperature Range: From minus 40 to plus 200 deg F.
3. Edge Seals, Low-Leakage Applications: Use inflatable blade edging or replaceable rubber blade seals and spring-loaded stainless-steel side seals, rated for leakage at less than 10 cfm per sq. ft. of damper area, at differential pressure of 4-inch wg when damper is held by torque of 50 in. x lbf; when tested according to AMCA 500D.

2.16 CONTROL CABLE

A. Electronic and fiber-optic cables for control wiring are specified in Division 26 Section "Voice and Data Communication Cabling."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that power supply is available to control units and operator workstation.

3.2 INSTALLATION

A. Install software in control units and operator workstation(s). Implement all features of programs to specified requirements and as appropriate to sequence of operation.

B. Connect and configure equipment and software to achieve sequence of operation specified.

C. Verify location of thermostats, humidistats, and other exposed control sensors with Drawings and room details before installation. Install devices 48 inches above the floor.
   1. Install averaging elements in ducts and plenums in crossing or zigzag pattern.

D. Install guards on thermostats in the following locations:
   1. Entrances.
   2. Public areas.
   3. Where indicated.

E. Install automatic dampers according to Division 23 Section "Duct Accessories."

F. Install damper motors on outside of duct in warm areas, not in locations exposed to outdoor temperatures.

G. Install labels and nameplates to identify control components according to Division 23 Section "Mechanical Identification."

H. Install hydronic instrument wells, valves, and other accessories according to Division 23 Section "Hydronic Piping."

I. Install refrigerant instrument wells, valves, and other accessories according to Division 23 Section "Refrigerant Piping."

J. Install duct volume-control dampers according to Division 23 Sections specifying air ducts.

K. Install electronic and fiber-optic cables according to Division 26 Section "Voice and Data Communication Cabling."

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections. Report results in writing.

B. Perform the following field tests and inspections and prepare test reports:
   1. Operational Test: After electrical circuitry has been energized, start units to confirm proper unit operation. Remove and replace malfunctioning units and retest.
   2. Test and adjust controls and safeties.
   3. Test calibration of electronic controllers by disconnecting input sensors and stimulating operation with compatible signal generator.
   4. Test each point through its full operating range to verify that safety and operating control set points are as required.
   5. Test each control loop to verify stable mode of operation and compliance with sequence of operation. Adjust PID actions.
   6. Test each system for compliance with sequence of operation.
   7. Test software and hardware interlocks.

C. DDC Verification:
   1. Verify that instruments are installed before calibration, testing, and loop or leak checks.
   2. Check instruments for proper location and accessibility.
   3. Check instrument installation for direction of flow, elevation, orientation, insertion depth, and other applicable considerations.
   4. Check instrument tubing for proper fittings, slope, material, and support.
   5. Check installation of air supply for each instrument.
   6. Check flow instruments. Inspect tag number and line and bore size and verify that inlet side is identified and that meters are installed correctly.
   7. Check pressure instruments, piping slope, installation of valve manifold, and self-contained pressure regulators.
   8. Check temperature instruments and material and length of sensing elements.
   9. Check control valves. Verify that they are in correct direction.
   10. Check air-operated dampers. Verify that pressure gages are provided and that proper blade alignment, either parallel or opposed, has been provided.
   11. Check DDC system as follows:
      a. Verify that DDC controller power supply is from emergency power supply, if applicable.
      b. Verify that wires at control panels are tagged with their service designation and approved tagging system.
      c. Verify that spare I/O capacity has been provided.
      d. Verify that DDC controllers are protected from power supply surges.

D. Replace damaged or malfunctioning controls and equipment and repeat testing procedures.

3.4 ADJUSTING

A. Calibrating and Adjusting:
   1. Calibrate instruments.
   2. Make three-point calibration test for both linearity and accuracy for each analog instrument.
   3. Calibrate equipment and procedures using manufacturer's written recommendations and instruction manuals. Use test equipment with accuracy at least double that of instrument being calibrated.
   4. Control System Inputs and Outputs:
      a. Check analog inputs at 0, 50, and 100 percent of span.

b. Check analog outputs using milliampere meter at 0, 50, and 100 percent output.
c. Check digital inputs using jumper wire.
d. Check digital outputs using ohmmeter to test for contact making or breaking.
e. Check resistance temperature inputs at 0, 50, and 100 percent of span using a precision-resistant source.

5. Flow:
   a. Set differential pressure flow transmitters for 0 and 100 percent values with 3-point calibration accomplished at 50, 90, and 100 percent of span.
   b. Manually operate flow switches to verify that they make or break contact.
6. Pressure:
   a. Calibrate pressure transmitters at 0, 50, and 100 percent of span.
   b. Calibrate pressure switches to make or break contacts, with adjustable differential set at minimum.
7. Temperature:
   a. Calibrate resistance temperature transmitters at 0, 50, and 100 percent of span using a precision-resistance source.
   b. Calibrate temperature switches to make or break contacts.
8. Stroke and adjust control valves and dampers without positioners, following the manufacturer's recommended procedure, so that valve or damper is 100 percent open and closed.
9. Stroke and adjust control valves and dampers with positioners, following manufacturer's recommended procedure, so that valve and damper is 0, 50, and 100 percent closed.
10. Provide diagnostic and test instruments for calibration and adjustment of system.
11. Provide written description of procedures and equipment for calibrating each type of instrument. Submit procedures review and approval before initiating startup procedures.

B. Adjust initial temperature and humidity set points.

C. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to three visits to Project during other than normal occupancy hours for this purpose.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain HVAC instrumentation and controls. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION 23 0900

SECTION 23 0950

TESTING, ADJUSTING, AND BALANCING

PART 1 - GENERAL

1.1. SUMMARY

A. This Section includes TAB to produce design objectives for the following:
   1. Air Systems.
   2. Duct leakage tests.
   3. Hydronic Piping Systems.
   4. HVAC equipment quantitative-performance settings.
   5. Duct mounted smoke detectors.
   6. Verifying that automatic control devices are functioning properly.
   7. Reporting results of activities and procedures specified in this Section.

1.2. DEFINITIONS

A. Adjust: To regulate fluid flow rate and air patterns at the terminal equipment, such as to reduce fan speed or adjust a damper.

B. Balance: To proportion flows within the distribution system, including submains, branches, and terminals, according to indicated quantities.

C. Barrier or Boundary: Construction, either vertical or horizontal, such as walls, floors, and ceilings that are designed and constructed to restrict the movement of airflow, smoke, odors, and other pollutants.

D. Draft: A current of air, when referring to localized effect caused by one or more factors of high air velocity, low ambient temperature, or direction of airflow, whereby more heat is withdrawn from a person's skin than is normally dissipated.

E. Static Head: The pressure due to the weight of the fluid above the point of measurement. In a closed system, static head is equal on both sides of the pump.

F. Suction Head: The height of fluid surface above the centerline of the pump on the suction side.

G. System Effect: A phenomenon that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system.

H. System Effect Factors: Allowances used to calculate a reduction of the performance ratings of a fan when installed under conditions different from those presented when the fan was performance tested.

I. TAB: Testing, adjusting, and balancing.

J. Terminal: A point where the controlled medium, such as fluid or energy, enters or leaves the distribution system.

1.3. SUBMITTALS

A. Qualification Data: Submit evidence that TAB firm and this Project's TAB team members meet the qualifications specified in "Quality Assurance" Article and below.

B. Sample Report Forms: Submit sample TAB report forms.

C. Certified TAB Reports: Submit three copies of reports prepared, as specified in this Section, on approved forms certified by TAB firm.

1.4. QUALITY ASSURANCE

A. TAB Firm Qualifications: Engage a TAB firm certified by either AABC or NEBB.

B. Certification of TAB Reports: Certify TAB field data reports. This certification includes the following:
   1. Review field data reports to validate accuracy of data and to prepare certified TAB reports.
   2. Certify that TAB team complied with approved TAB plan and the procedures specified and referenced in this Specification.

C. TAB Report Forms: Use TAB firm's forms approved by Architect.

D. Instrumentation Type, Quantity, and Accuracy: As described in AABC's "National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems or NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems," Section II, "Required Instrumentation for NEBB Certification."

E. Instrumentation Calibration: Calibrate instruments at least every six months or more frequently if required by instrument manufacturer.
   1. Keep an updated record of instrument calibration that indicates date of calibration and the name of party performing instrument calibration.

1.5. PROJECT CONDITIONS

A. Partial Owner Occupancy: Owner may occupy completed areas of building before Substantial Completion. Cooperate with Owner during TAB operations to minimize conflicts with Owner's operations.

1.6. COORDINATION

A. Coordinate the efforts of factory-authorized service representatives for systems and equipment, HVAC controls installers, and other mechanics to operate HVAC systems and equipment to support and assist TAB activities.

B. Perform TAB after leakage and pressure tests on air and water distribution systems have been satisfactorily completed.

D. Coordinate all TAB work through the contract schedule. Certified TAB reports are required one month prior to Substantial Completion to allow thorough review. The Certified TAB report must be approved by the Owner, Engineer and Commissioning Firm (if applicable) before the project can receive Substantial Completion.

PART 2 - PRODUCTS (Not Applicable)

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine approved submittal data of HVAC systems and equipment.

B. Examine system and equipment installations to verify that they are complete and that testing, cleaning, adjusting, and commissioning specified in individual Sections have been performed.

C. Examine HVAC system and equipment installations to verify that indicated balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers, are properly installed, and that their locations are accessible and appropriate for effective balancing and for efficient system and equipment operation.

D. Examine HVAC equipment to ensure that clean filters have been installed, bearings are greased, belts are aligned and tight, and equipment with functioning controls is ready for operation.

E. Examine terminal units, such as variable-air-volume boxes, to verify that they are accessible and their controls are connected and functioning.

F. Examine plenum ceilings used for return air to verify that they are airtight with no openings to the exterior.

G. Examine strainers for clean screens and proper perforations.

H. Examine heat-transfer coils for correct piping connections and for clean and straight fins.

I. Examine equipment for installation and for properly operating safety interlocks and controls.

J. Examine automatic temperature system components to verify the following:
   1. Dampers, valves, and other controlled devices are operated by the intended controller.
   2. Dampers and valves are in the position indicated by the controller.
   3. Integrity of valves and dampers for free and full operation and for tightness of fully closed and fully open positions. This includes dampers in multi-zone units, mixing boxes, and variable-air-volume terminals.
   4. Automatic modulating and shutoff valves, including two-way valves and three-way mixing and diverting valves, are properly connected.
   5. Thermostats and humidistats are located to avoid adverse effects of sunlight, drafts, and cold walls.
   6. Sensors are located to sense only the intended conditions.
   7. Sequence of operation for control modes is according to the Contract Documents.
   8. Controller set points are set at indicated values.
   9. Interlocked systems are operating.
   10. Changeover from heating to cooling mode occurs according to indicated values.

K. Report deficiencies discovered before and during performance of TAB procedures. Observe and record system reactions to changes in conditions. Record default set points if different from indicated values.

3.2 PROCEDURES FOR TESTING AND BALANCING

A. Perform testing and balancing procedures on each system according to the procedures contained in AABC's "National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems" or NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems" and this Section.

B. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary to allow adequate performance of procedures. After testing and balancing, close probe holes and patch insulation with new materials identical to those removed. Restore vapor barrier and finish according to insulation Specifications for this Project.

C. Mark equipment and balancing device settings with paint or other suitable, permanent identification material, including damper-control positions, valve position indicators, fan-speed-control levers, and similar controls and devices, to show final settings.

D. Take and report testing and balancing measurements in inch-pound (IP) units.

3.3 PROCEDURES FOR DUCTWORK LEAKAGE TESTING

A. Scope and Leakage Rate: Refer to Division 23 Section “Metal Ducts, Part 3, Article “Field Quality Control” for extent of ductwork to be tested and allowable leakage rates.

B. Prior to testing, submit drawings indicating sections of ductwork to be tested, including duct surface area and allowable leakage (CFM) calculations.

C. Leakage testing shall be performed in accordance with ASHRAE/SMACNA Standard 126 “Method of Testing HVAC Air Ducts and Fittings” except as noted otherwise on drawings or specifications.

D. Submit a report certifying ductwork testing and results.

E. Ductwork failing test shall be reconstructed and retested until satisfactory.

3.4 GENERAL PROCEDURES FOR BALANCING AIR SYSTEMS

A. Prepare test reports for both fans and outlets. Obtain manufacturer's outlet factors and recommended testing procedures. Crosscheck the summation of required outlet volumes with required fan volumes.

B. Prepare schematic diagrams of systems' "as-built" duct layouts.

C. For variable-air-volume systems, develop a plan to simulate diversity.

D. Verify that motor starters are equipped with properly sized thermal protection.

E. Check dampers for proper position to achieve desired airflow path.

F. Check for airflow blockages.

G. Check for proper sealing of air-handling unit components.

H. Check for proper sealing of air duct system.

3.5 PROCEDURES FOR CONSTANT-VOLUME AIR SYSTEMS

A. Adjust fans to deliver total indicated airflows within the maximum allowable fan speed listed by fan manufacturer.
   1. Measure fan static pressures to determine actual static pressure as follows:
      a. Measure outlet static pressure as far downstream from the fan as practicable and upstream from restrictions in ducts such as elbows and transitions.
      b. Measure static pressure directly at the fan outlet or through the flexible connection.
      c. Measure inlet static pressure of single-inlet fans in the inlet duct as near the fan as possible, upstream from flexible connection and downstream from duct restrictions.
      d. Measure inlet static pressure of double-inlet fans through the wall of the plenum that houses the fan.
   2. Measure static pressure across each component that makes up an air-handling unit, rooftop unit, and other air-handling and -treating equipment.
      a. Simulate dirty filter operation and record the point at which maintenance personnel must change filters.
   3. Measure static pressures entering and leaving other devices such as sound traps, heat recovery equipment, under final balanced conditions.
   4. Compare design data with installed conditions to determine variations in design static pressures versus actual static pressures. Recommend corrective action to align design and actual conditions.
   5. Make required adjustments to pulley sizes to accommodate fan-speed changes.
   6. Do not make fan-speed adjustments that result in motor overload. Consult equipment manufacturers about fan-speed safety factors. Modulate dampers and measure fan-motor amperage to ensure that no overload will occur. Measure amperage in full cooling, full heating, economizer, and any other operating modes to determine the maximum required brake horsepower.

B. Adjust volume dampers for main duct, submain ducts, and major branch ducts to indicated airflows within specified tolerances.
   1. Measure static pressure at a point downstream from the balancing damper and adjust volume dampers until the proper static pressure is achieved.
      a. Where sufficient space in submain and branch ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow for that zone.

2. Re-measure each submain and branch duct after all have been adjusted. Continue to adjust submain and branch ducts to indicated airflows within specified tolerances.

C. Measure terminal outlets and inlets without making adjustments.
1. Measure terminal outlets using a direct-reading hood or outlet manufacturer's written instructions and calculating factors.

D. Adjust terminal outlets and inlets for each space to indicated airflows within specified tolerances of indicated values. Make adjustments using volume dampers rather than extractors and the dampers at air terminals.
1. Adjust each outlet in same room or space to within specified tolerances of indicated quantities without generating noise levels above the limitations prescribed by the Contract Documents.
2. Adjust patterns of adjustable outlets for proper distribution without drafts.

3.6 PROCEDURES FOR VARIABLE-AIR-VOLUME SYSTEMS

A. Compensating for Diversity: When the total airflow of all terminal units is more than the indicated airflow of the fan, place a selected number of terminal units at a minimum set-point airflow condition until the total airflow of the terminal units equals the indicated airflow of the fan. Select the reduced airflow terminal units so they are distributed evenly among the branch ducts.

B. Pressure-Independent, Variable-Air-Volume Systems: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:
1. Set outside-air dampers at minimum and return- and exhaust-air dampers at a position that simulates full-cooling load.
2. Select the terminal unit that is most critical to the supply-fan airflow and static pressure. Measure static pressure. Adjust system static pressure so the entering static pressure for the critical terminal unit is not less than the sum of terminal-unit manufacturer's recommended minimum inlet static pressure plus the static pressure needed to overcome terminal-unit discharge system losses.
3. Measure total system airflow. Adjust to within indicated airflow.
4. Set terminal units at maximum airflow and adjust controller or regulator to deliver the designed maximum airflow. Use terminal-unit manufacturer's written instructions to make this adjustment. When total airflow is correct, balance the air outlets downstream from terminal units as described for constant-volume air systems.
5. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow as described for constant-volume air systems.
    a. If air outlets are out of balance at minimum airflow, report the condition but leave outlets balanced for maximum airflow.
6. Re-measure the return airflow to the fan while operating at maximum return airflow and minimum outside airflow. Adjust the fan and balance the return-air ducts and inlets as described for constant-volume air systems.
7. Measure static pressure at the most critical terminal unit and coordinate with control contractor to adjust the static-pressure controller at the main supply-air sensing station to ensure that adequate static pressure is maintained at the most critical unit.
8. Record the final fan performance data.

3.7 GENERAL PROCEDURES FOR HYDRONIC SYSTEMS

A. Prepare test reports with pertinent design data and number in sequence starting at pump to end of system. Check the sum of branch-circuit flows against approved pump flow rate. Correct variations that exceed plus or minus 5 percent.

B. Prepare hydronic systems for testing and balancing according to the following, in addition to the general preparation procedures specified above:
   1. Open all manual valves for maximum flow.
   2. Check makeup-water-station pressure gage for adequate pressure (min. 5 psig) for highest vent.
   3. Check flow-control valves for specified sequence of operation and set at indicated flow.
   4. Set system controls so automatic valves are wide open to heat exchangers.
   5. Check pump-motor load. If motor is overloaded, throttle main flow-balancing device so motor nameplate rating is not exceeded.

3.8 PROCEDURES FOR HYDRONIC SYSTEMS

A. Measure water flow at pumps. Use the following procedures:
   1. Verify impeller size by operating the pump with the discharge valve closed. Read pressure differential across the pump. Convert pressure to head and correct for differences in gage heights. Note the point on manufacturer's pump curve at zero flow and verify that the pump has the intended impeller size.
   2. Check system resistance. With all valves open, read pressure differential across the pump and mark pump manufacturer's head-capacity curve. Adjust pump discharge valve until indicated water flow is achieved.
   3. Verify pump-motor brake horsepower. Calculate the intended brake horsepower for the system based on pump manufacturer's performance data. Compare calculated brake horsepower with nameplate data on the pump motor. Report conditions where actual amperage exceeds motor nameplate amperage.
   4. Report flow rates that are not within plus or minus 5 percent of design.

B. Set calibrated balancing valves, if installed, at calculated presettings.

C. Measure flow at all stations and adjust, where necessary, to obtain first balance.
   1. System components that have Cv rating or an accurately cataloged flow-pressure-drop relationship may be used as a flow-indicating device.

D. Measure flow at main balancing station and set main balancing device to achieve flow that is 5 percent greater than indicated flow.

E. Adjust balancing stations to within specified tolerances of indicated flow rate as follows:
   1. Determine the balancing station with the highest percentage over indicated flow.
   2. Adjust each station in turn, beginning with the station with the highest percentage over indicated flow and proceeding to the station with the lowest percentage over indicated flow.
   3. Record settings and mark balancing devices.

F. Measure pump flow rate and make final measurements of pump amperage, voltage, rpm, pump heads, and systems' pressures and temperatures including outdoor-air temperature.

G. Measure the differential-pressure control valve settings existing at the conclusions of balancing.

3.9 PROCEDURES FOR VARIABLE-FLOW HYDRONIC SYSTEMS

A. Balance systems with automatic two- and three-way control valves by setting systems at maximum flow through heat-exchange terminals and proceed as specified above for hydronic systems.

B. Compensating for Diversity: When the total water flow of all terminal units is more than the indicated water flow of the pump, place a selected number of terminal units at a minimum set-point water flow condition until the total water flow of the terminal units equals the indicated water flow of the pump. Select the reduced water flow terminal units so they are distributed evenly among the branch pipes.

C. Measure differential static pressure at the most critical terminal unit or air handler and coordinate with controls contractor to adjust the differential pressure controller, at the main differential sensor/transmitter, to ensure that adequate differential pressure is maintained at the most critical unit.

D. Record the final pump performance data.

3.10 PROCEDURES FOR MOTORS

A. Motors, 1/2 HP and Larger: Test at final balanced conditions and record the following data:
1. Manufacturer, model, and serial numbers.
2. Motor horsepower rating.
3. Motor rpm.
4. Efficiency rating.
5. Nameplate and measured voltage, each phase.
6. Nameplate and measured amperage, each phase.
7. Starter thermal-protection-element rating.

B. Motors Driven by Variable-Frequency Controllers: Test for proper operation at speeds varying from minimum to maximum. Test the manual bypass for the controller to prove proper operation. Record observations, including controller manufacturer, model and serial numbers, and nameplate data.

3.11 PROCEDURES FOR CHILLERS

A. Balance water flow through each evaporator and condenser to within specified tolerances of indicated flow with all pumps operating. With only one chiller operating in a multiple chiller installation, do not exceed the flow for the maximum tube velocity recommended by the chiller manufacturer. Measure and record the following data with each chiller operating at design conditions:
1. Evaporator-water entering and leaving temperatures, pressure drop, and water flow.
2. If water-cooled chillers, condenser-water entering and leaving temperatures, pressure drop, and water flow.

3.12 PROCEDURES FOR HEAT-TRANSFER COILS

A. Water Coils: Measure the following data for each coil:
1. Water flow rate.
2. Water pressure drop.
3. Airflow.
4. Air pressure drop.

B. Electric-Heating Coils: Measure the following data for each coil:
1. Nameplate data.
2. Airflow.
3. Entering- and leaving-air temperature at full load.
4. Voltage and amperage input of each phase at full load and at each incremental stage.

C. Refrigerant Coils: Measure the following data for each coil:
1. Airflow.
2. Air pressure drop.

3.13 PROCEDURES FOR DUCT MOUNTED SMOKE DETECTORS TESTING

A. All duct smoke detectors shall be tested to ensure that the devices properly sample the air stream.

B. The tests shall be made in accordance with the smoke detector manufacturer’s requirements and instructions.

C. Provide testing documentation so that it can be included with the Closeout Documents for the fire alarm system.

3.14 TEMPERATURE-CONTROL VERIFICATION

A. Verify that controllers are calibrated and commissioned.

B. Check transmitter and controller locations and note conditions that would adversely affect control functions.

C. Record controller settings and note variances between set points and actual measurements.

D. Check the operation of limiting controllers (i.e., high- and low-temperature controllers).

E. Check free travel and proper operation of control devices such as damper and valve operators.

F. Check the sequence of operation of control devices. Note air pressures and device positions and correlate with airflow and water flow measurements. Note the speed of response to input changes.

G. Check the interaction of electrically operated switch transducers.

H. Check the interaction of interlock and lockout systems.

I. Record voltages of power supply and controller output. Determine whether the system operates on a grounded or non-grounded power supply.

J. Note operation of electric actuators using spring return for proper fail-safe operations.

3.15 TOLERANCES

A. Set HVAC system airflow and water flow rates within the following tolerances:
1. Supply, Return, and Exhaust Fans and Equipment with Fans: Plus 10 to minus 10 percent.
2. Air Outlets and Inlets: Plus 10 to minus 10 percent.
3. Cooling-Water Flow Rate: Plus 10 to minus 10 percent.

3.16 REPORTING

A. Status Reports: As Work progresses, prepare reports to describe deficiencies and problems found in systems being tested and balanced.

3.17 FINAL REPORT

A. General: Typewritten, or computer printout in letter-quality font, on standard bond paper, bound, tabulated, and divided into sections by tested and balanced systems.

B. Include a certification sheet in front of binder signed by the certified testing and balancing Agent.
1. Include a list of instruments used for procedures, along with proof of calibration.

C. General Report Data: In addition to form titles and entries, include the following data in the final report, as applicable:
1. Title page.
2. Name and address of TAB firm.
3. Project name.
4. Project location.
5. Architect's name and address.
6. Engineer's name and address.
7. Contractor's name and address.
8. Report date.
9. Signature of TAB firm who certifies the report.
10. Table of Contents.

11. Summary of contents including the following:
    a. Indicated versus final performance.
    b. Notable characteristics of systems.
    c. Description of system operation sequence if it varies from the Contract Documents.
12. Nomenclature sheets for each item of equipment.
13. Data for terminal units, including manufacturer, type, and size.
14. Notes to explain why certain final data in the body of reports varies from indicated values.
15. Test conditions for fans and pump performance forms including the following:
    a. Settings for outside-, return-, and exhaust-air dampers.
    b. Conditions of filters.
    c. Face and bypass damper settings at coils.
    d. Fan drive settings including settings and percentage of maximum pitch diameter.
    e. Settings for supply-air, static-pressure controller.
    f. Other system operating conditions that affect performance.

D. System Diagrams: Include schematic layouts of air distribution systems. Present each system with single-line diagram and include the following:
1. Quantities of outside, supply, return, and exhaust airflows.
2. Terminal units.
3. Balancing stations.

E. Air-Handling Unit Test Reports: For air-handling units with coils, include the following:
1. Unit Data: Include the following:
    a. Unit identification.
    b. Location.
    c. Make and type.
    d. Model number and unit size.
    e. Manufacturer's serial number.
    f. Sheave make, size in inches, and bore.
    g. Sheave dimensions, center-to-center, and amount of adjustments in inches.
    h. Number of belts, make, and size.
    i. Number of filters, type, and size.
2. Motor Data:
    a. Make and frame type and size.
    b. Horsepower and rpm.
    c. Volts, phase, and hertz.
    d. Full-load amperage and service factor.
    e. Sheave make, size in inches, and bore.
    f. Sheave dimensions, center-to-center, and amount of adjustments in inches.
3. Test Data (Indicated and Actual Values):
    a. Total airflow rate in cfm.
    b. Total system static pressure in inches wg.
    c. Fan rpm.
    d. Discharge static pressure in inches wg.
    e. Filter static-pressure differential in inches wg.
    f. Preheat coil static-pressure differential in inches wg.
    g. Cooling coil static-pressure differential in inches wg.
    h. Heating coil static-pressure differential in inches wg.
    i. Outside airflow in cfm.
    j. Return airflow in cfm.

F. Apparatus-Coil Test Reports:
   1. Coil Data:
      a. System identification.
      b. Location.
      c. Coil type.
   2. Test Data (Indicated and Actual Values):
      a. Airflow rate in cfm.
      b. Air pressure drop in inches wg.
      c. Return-air, wet- and dry-bulb temperatures in deg F.
      d. Entering-air, wet- and dry-bulb temperatures in deg F.
      e. Leaving-air, wet- and dry-bulb temperatures in deg F.
      f. Water flow rate in gpm.
      g. Water pressure differential in feet of head or psig.
      h. Entering-water temperature in deg F.
      i. Leaving-water temperature in deg F.

G. Electric-Coil Test Reports: For electric furnaces, duct coils, and electric coils installed in central-station air-handling units, include the following:
   1. Unit Data:
      a. System identification.
      b. Location.
      c. Coil identification.
   2. Test Data (Indicated and Actual Values):
      a. Airflow rate in cfm.
      b. Entering-air temperature in deg F.
      c. Leaving-air temperature in deg F.
      d. Voltage at each connection.

H. Fan Test Reports: For supply, return, and exhaust fans, include the following:
   1. Fan Data:
      a. System identification.
      b. Location.
   2. Motor Data:
      a. Make and frame type and size.
      b. Horsepower and rpm.
      c. Volts, phase, and hertz.
      d. Full-load amperage and service factor.
      e. Sheave make, size in inches, and bore.
      f. Sheave dimensions, center-to-center, and amount of adjustments in inches.
      g. Number of belts, make, and size.
   3. Test Data (Indicated and Actual Values):
      a. Total airflow rate in cfm.
      b. Total system static pressure in inches wg.
      c. Fan rpm.
      d. Discharge static pressure in inches wg.
      e. Suction static pressure in inches wg.

I. Round and Rectangular Duct Traverse Reports: Include a diagram with a grid representing the duct cross-section and record the following:
   1. Report Data:
      a. System and air-handling unit number.

b. Location and zone.
c. Duct static pressure in inches wg.
d. Duct size in inches.
e. Duct area in sq. ft.
f. Indicated airflow rate in cfm.
g. Indicated velocity in fpm.
h. Actual airflow rate in cfm.
i. Actual average velocity in fpm.

J. Air-Terminal-Device Reports:
1. Unit Data:
a. System and air-handling unit identification.
b. Location.
c. Air-terminal-device number from system diagram.
d. Air-terminal-device type and model number.
e. Air-terminal-device size.
f. Air-terminal-device effective area in sq. ft.
2. Test Data (Indicated and Actual Values):
a. Airflow rate in cfm.
b. Preliminary airflow rate as needed in cfm.
c. Final airflow rate in cfm.

K. System-Coil Reports: For reheat coils and water coils of terminal units, include the following:
1. Unit Data:
a. System and air-handling unit identification.
b. Location and zone.
c. Room or riser served.
d. Flowmeter type.
2. Test Data (Indicated and Actual Values):
a. Airflow rate in cfm.
b. Entering-water temperature in deg F.
c. Leaving-water temperature in deg F.
d. Water pressure drop in feet of head or psig.
e. Entering-air temperature in deg F.
f. Leaving-air temperature in deg F.

L. Packaged Chiller Reports:
1. Unit Data:
a. Unit identification.
b. Make and model number.
2. Water-Cooled Condenser Test Data (Indicated and Actual Values):
a. Entering water temperature in deg F.
b. Leaving water temperature in deg F.
c. Entering water pressure in feet of head or psig.
d. Water pressure differential in feet of head or psig.
3. Evaporator Test Reports (Indicated and Actual Values):
a. Entering water temperature in deg F.
b. Leaving water temperature in deg F.
c. Entering water pressure in feet of head or psig.
d. Water pressure differential in feet of head or psig.

M. Pump Test Reports: Calculate impeller size by plotting the shutoff head on pump curves and include the following:
   1. Unit Data:
      a. Unit identification.
      b. Location.
      c. Service.
      d. Make and size.
      e. Model and serial numbers.
      f. Water flow rate in gpm.
      g. Water pressure differential in feet of head or psig.
      h. Required net positive suction head in feet of head or psig.
      i. Pump rpm.
      j. Impeller diameter in inches.
      k. Motor make and frame size.
      l. Motor horsepower and rpm.
      m. Voltage at each connection.
      n. Amperage for each phase.
      o. Full-load amperage and service factor.
      p. Seal type.
   2. Test Data (Indicated and Actual Values):
      a. Static head in feet of head or psig.
      b. Pump shutoff pressure in feet of head or psig.
      c. Actual impeller size in inches.
      d. Full-open flow rate in gpm.
      e. Full-open pressure in feet of head or psig.
      f. Final discharge pressure in feet of head or psig.
      g. Final suction pressure in feet of head or psig.
      h. Final total pressure in feet of head or psig.
      i. Final water flow rate in gpm.
      j. Voltage at each connection.
      k. Amperage for each phase.

N. Instrument Calibration Reports:
   1. Report Data:
      a. Instrument type and make.
      b. Serial number.
      c. Application.
      d. Dates of calibration.

3.18 INSPECTIONS

A. Before final acceptance of the Tab Report:
   1. Owner or Architect shall randomly select measurements documented in the final report to be rechecked. The rechecking shall be limited to either 10 percent of the total measurements recorded, or the extent of measurements that can be accomplished in a normal 8-hour business day.
   2. If the rechecks yield measurements that differ from the measurements documented in the final report by more than the tolerances allowed, the measurements shall be noted as "FAILED."
   3. If the number of "FAILED" measurements is greater than 10 percent of the total measurements checked during the final inspection, the testing and balancing shall be considered incomplete and shall be rejected.

4. TAB firm shall recheck all measurements and make adjustments. Revise the final report and balancing device settings to include all changes and resubmit the final report.
5. Request a second final inspection.

END OF SECTION 23 0950

This page intentionally left blank

SECTION 23 2113

HYDRONIC PIPING

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Pipe and pipe fittings for:
   1. Chilled water piping.
   2. Equipment drains and overflows piping.
   3. Pre-insulated and factory cladded piping.
   4. Welded branch and tap connections.
   5. Pipe hangers and supports.
   6. Joining materials.
   7. Unions, flanges, and couplings.
   8. Dielectric fittings.
   9. Transition fittings.

B. Valves:
   1. Gate valves.
   2. Globe or angle valves.
   3. Ball valves.
   4. Below grade ball valves.
   5. Plug valves.
   6. Butterfly valves.
   7. Check valves.

C. Water treatment for closed loop systems:
   1. HVAC water treatment equipment.
   2. HVAC Water filtration equipment.
   3. HVAC water treatment chemicals.

1.2 RELATED SECTIONS

A. Section 230062 “Hangers and Supports for HVAC Piping and Equipment” for pipe and equipment supports.

B. Section 230900 “HVAC Instrumentation and Controls” for Automatic Temperature-Control Valves and Actuators.

C. Section 312000 “Earth Moving” for excavating, trenching, and backfilling.

1.3 SYSTEM DESCRIPTION

A. Where more than one piping system material is specified for an application, Contractor may use any of the listed pipe materials for that application.

B. Where more than one piping system material is applied, ensure system components are compatible and joined to ensure the integrity of the system is not jeopardized. Provide necessary joining fittings. Ensure flanges, unions, and couplings for servicing are consistently provided.

C. Use unions, flanges, and couplings at control valves and at equipment or apparatus connections. Do not use direct welded or threaded connections to control valves, equipment, or other apparatus.

D. Use non-conducting dielectric connections whenever joining dissimilar metals.

E. Provide pipe hangers and supports in accordance with ASTM B31.9 unless indicated otherwise.

F. Use spring loaded check valves on discharge of pumps.

G. Use lug end butterfly valves to isolate equipment for pipe size NPS 2-1/2 and larger.

H. Use NPS ¾ ball valves with hose end connection and cap for drains at main shut-off valves, low points of piping, bases of vertical risers, and at equipment.

1.4 ACTION SUBMITTALS

A. Product Data for each of the following
   1. Pipe material, pipe fittings, valves, and accessories.
   2. Chemical treatment for closed loop systems.

B. Welders certificates.

C. Anchors for Underground Piping: Concrete pipe anchor sizes and steel reinforcement bars for underground heating water pipes. Calculations shall be signed and sealed by a Professional Engineer registered in the State where project is located.

1.5 INFORMATIONAL SUBMITTALS

A. Welding certificates.

B. Field quality-control test reports.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Company specializing in performing the work of this section with minimum three years documented experience.

B. Steel Support Welding: Qualify processes and operators according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

C. Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX.
   1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
   2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.
   3. Welder's Certificate: Provide certificate of compliance indicating approval of welders prior to any welding. Certificate must be obtained from an independent certification agency, dated within the past 12 months, and must include welders I.D. Number. Test must be for 6G position, E-6010 root and E-7018 filler. Provide photo identification (Driver’s License). Welder must stamp each weld with his I.D.

D. ASME Compliance: Comply with ASME B31.9, "Building Services Piping" for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label.

E. HVAC Water-Treatment Service Provider Qualifications:
   1. An experienced HVAC water-treatment service provider capable of analyzing water qualities, installing water-treatment equipment, and applying water treatment as specified in this Section.
   2. Have a certified “In-House” laboratory capable of performing all analysis required with water system.
   3. Water treatment work shall be supplied by a single provider.

1.7 PERFORMANCE REQUIREMENTS FOR HVAC WATER TREATMENT

A. Water quality for HVAC systems shall minimize corrosion, scale buildup, and biological growth for optimum efficiency of HVAC equipment without creating a hazard to operating personnel or the environment.

B. Base HVAC water treatment on quality of water available at project site, HVAC system equipment material characteristics and functional performance characteristics, operating personnel capabilities, and requirements and guidelines of authorities having jurisdiction.

C. Closed hydronic systems, including chilled water, shall have the following water qualities:
1. pH: Maintain a value within 9.0 to 10.5.
2. "P" Alkalinity: Maintain a value within 100 to 500 ppm.
3. Boron: Maintain a value within 100 to 200 ppm.
4. Chemical Oxygen Demand: Maintain a maximum value of 100 ppm.
5. Soluble Copper: Maintain a maximum value of 0.20 ppm.
6. TDS: Maintain a maximum value of 10 ppm.
7. Ammonia: Maintain a maximum value of 20 ppm.
8. Free Caustic Alkalinity: Maintain a maximum value of 20 ppm.
9. Microbiological Limits:
   a. Total Aerobic Plate Count: Maintain a maximum value of 1000 organisms/ml.
   b. Total Anaerobic Plate Count: Maintain a maximum value of 100 organisms/ml.
   c. Nitrate Reducers: Maintain a maximum value of 100 organisms/ml.
   d. Sulfate Reducers: Maintain a maximum value of 0 organisms/ml.
   e. Iron Bacteria: Maintain a maximum value of 0 organisms/ml.

PART 2 - PRODUCTS

2.1 CHILLED WATER PIPING, BURIED

A. Pre-Insulated Pipe: See Pre-Insulated Piping System article below.

B. Steel Pipe: ASTM A53, Schedule 40, 0.375-inch wall sizes for NPS 12 and over, black.
1. Fittings: ASTM A234, forged steel welding type.
2. Joints: AWS D1.1, welded.
3. Casing: Closed glass cell insulation with Pittwrap jacketing.

2.2 CHILLED WATER PIPING, ABOVE GROUND

A. Steel Pipe: ASTM A53 / A53M, Schedule 40, 0.375-inch wall sizes for NPS 12 and over, black, with plain ends.
1. Fittings: ASTM B16.39, malleable iron threaded or ASTM A234 / A234M wrought steel welded. Wall thickness to match adjoining pipe.
2. Joints: NPS 2-1/2 and smaller to be threaded; NPS 3 and larger to be AWS D1.1 welded.
3. Pipe Nipples: Pipe nipples to be Schedule 40 stainless steel.

B. Copper Tubing: ASTM B88, Type L, drawn temper.
1. Fittings: ASME B16.22, wrought copper.
2. Joints: NPS 4 and smaller, Solder. NPS 6 and larger, Brazed.

2.3 EQUIPMENT DRAINS AND OVERFLOWS PIPING

A. Copper Tubing: ASTM B88, Type L, drawn temper.
1. Fittings: ASME B16.22, wrought copper.
2. Joints: NPS 4 and smaller, Solder. NPS 6 and larger, Brazed.

2.4 PRE-INSULATED AND FACTORY CLADDED PIPING SYSTEMS

A. Manufacturers:
1. Basis of Design:
   a. Chilled Water: Thermacor Process, Inc.: Model Ferro-Therm.
   b. Non-Potable Water: Thermacor Process, Inc.: Model Copper-Therm.

2. Insul-Pipe System, Inc.
3. Perma-Pipe, Inc.
4. Ravanco Piping Systems, Inc.
5. Thermal Pipe Systems, LP.

B. Furnish a complete HDPE jacketed system of factory pre-insulated (insulation not required for cladded only systems) piping for the specified service. All pre-insulated pipe, fittings, insulating materials, and technical support shall be provided by the pre-insulated piping system manufacturer.

C. A complete layout of the system, showing anchors, expansion provisions, and building entrance details, shall be provided by the pre-insulated pipe manufacturer.

D. Carrier Pipe:
1. Chilled Water Pipe: Carrier pipe shall be steel ASTM A-53, Grade B., ERW (Type E) or seamless (Type S), standard weight for sizes NPS 2 and larger and shall be ASTM A-106/A-53, standard weight for sizes NPS 1-1/2 and smaller. All carbon steel pipe shall have ends cut square and beveled for butt-welding, except sizes smaller than 2-inch shall be socket-welded. Straight sections of factory insulated pipe shall have 6-inches of exposed pipe at each end for field joint fabrication.
2. Non-Potable Water: Carrier shall be Type K Drawn-Temper Copper tube, conforming to ASTM B-88. All copper piping shall have ends cut square for socket brazing. Straight sections of factory insulated pipe shall have 6-inches of exposed pipe at each end for field joint fabrication. Field joining of piping shall utilize approved methods of brazing with alloys melting at or above 1100°F.

E. Insulation: Polyurethane foam insulation shall be sprayed or injected with one shot into the annular space between carrier pipe and jacket with a minimum thickness as scheduled on chart below. Insulation shall be rigid, 90% closed cell polyurethane with a minimum 2.0 pounds per cubic foot density, compressive strength of 30 psig, and coefficient of thermal conductivity (K-Factor) not higher than 0.18 at 75 deg F per ASTM C-518. Maximum allowable operating temperature shall not be less than 250 deg F.

MINIMUM INSULATION THICKNESS	
Pipe size	Insulation Thickness
NPS 1/2	2.15-inches
NPS 3/4	2.04-inches
NPS 1	1.91-inches
NPS 1-1/4	1.74-inches
NPS 1-1/2	1.62-inches
NPS 2	1.38-inches
NPS 2-1/2	1.77-inches
NPS 3	1.46-inches
NPS 4	1.96-inches

F. Jacketing: Jacketing material shall be extruded, black, high-density polyethylene (HDPE), having a minimum wall thickness of 125 mils for jacket sizes less than or equal to 12-inches, 150 mils for

jacket sizes 12- to 20-inches, and 175 mils for jacket sizes greater than 20-inches. Provide a secure bond between the jacket and foam insulation/pipe preventing any ingression of water at the jacket/ foam interface.

G. Straight run field joints shall be field insulated per the manufacturer's instructions, using polyurethane foam poured in an HDPE sleeve and sealed with heat shrink tape. All joint closures and insulation shall occur at straight sections of pipe. All insulation and jacketing materials shall be furnished by pre-insulated piping system manufacturer.

H. Fittings are factory prefabricated and pre-insulated (insulation not required for jacketed only pipe systems) with polyurethane foam to the thickness specified and jacketed with a one-piece seamless molded HDPE fitting cover, a butt fusion welded, or an extrusion welded and mitered HDPE jacket. Carrier pipe fittings shall be butt-welded, except sizes smaller than 2" shall be socket-welded. Fittings include expansion loops, elbows, tees, reducers, and anchors. Elbows, loops, offsets, or any other direction changes for steel pipe shall conform to the standards set by ASME B31.1, Code for Power Piping.

2.5 WELDED BRANCH AND TAP CONNECTIONS

A. No mitering or notching for fittings allowed. Weldolets or threadolets may be used in lieu of the fittings where branch size is 2 pipe sizes smaller than main unless fittings are noted on the drawings. Forged steel half couplings may be used for drain, vent, and gauge connections.

2.6 PIPE HANGERS AND SUPPORTS

A. Provide hangers and supports in accordance with Section 230062 "Hangers and Supports for HVAC Piping and Equipment."

2.7 JOINING MATERIALS

A. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
   1. ASME B16.21, nonmetallic, flat, asbestos free, spiral wound 1/8-inch maximum thickness unless thickness or specific material is indicated.
      a. Full-Face Type: For flat-face, Class 150, cast-iron and cast-bronze flanges.

B. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

C. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

D. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for joining copper with copper; or BAg-1, silver alloy for joining copper with bronze or steel.

E. Welding Filler Metals: Comply with AWS D10.12/D10.12M for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.8 UNIONS, FLANGES AND COUPLINGS

A. Unions for Pipe NPS 2 and Under:
   1. Steel Piping: ASME B16.39, 150 psig malleable-iron, threaded.
   2. Copper Pipe: Wrought-copper unions, ASME B16.22, soldered.

B. Flanges for Pipe NPS 2-1/2 and Above:
   1. Steel Piping: Wrought Cast- and Forged-Steel Flanges and Flanged Fittings: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connections, and facings:
      a. Material Group: 1.1.
      b. End Connections: Butt welding.

2. Copper Pipe: Bronze.
3. Pipe Flange Gasket Materials: Thickness, material, and type suitable for fluid to be handled and working temperatures and pressures.
    a. ASME B16.21, nonmetallic, flat, asbestos free, spiral wound 1/8-inch maximum thickness unless thickness or specific material is indicated.
    b. Full-Face Type: For flat-face, Class 150, cast-iron and cast-bronze flanges.
4. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

C. Steel Pipe Nipples: ASTM A733, same wall thicknesses as pipe in which they are installed.

2.9 DIELECTRIC FITTINGS

A. Dielectric Nipples:
1. Manufacturers:
    a. Jones Stephens Corp., Series D006-753 through D006-700.
    b. Grinnell Mechanical Products.
    c. Perfection Corp.
    d. Precision Plumbing Products, Inc.
    e. Sioux Chief Manufacturing Co., Inc.
    f. Victaulic Co. of America; Clearflow Dielectric Waterway Style 47.
2. Description:
    a. Standard: IAPMO PS 66.
    b. Electroplated steel nipple. complying with ASTM F 1545.
    c. Pressure Rating: 300 psig at 225 deg F.
    d. End Connections: Male threaded.
    e. Lining: Inert and noncorrosive, propylene

B. Dielectric Flanges:
1. Manufacturers:
    a. Capital Manufacturing.
    b. Central Plastics.
    c. Watts.
    d. Wilkins, a Zurn Company.
2. Description:
    a. Standard: ASSE 1079.
    b. Factory-fabricated, bolted, companion-flange assembly.
    c. End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.

C. Dielectric Flange Insulating Kits:
1. Non-conducting materials for field assembly or companion flanges.
2. Pressure Rating: 150 psig.
3. Gasket: Neoprene or phenolic.
4. Bolt Insulation Sleeves: Phenolic or polyethylene.
5. Washers: Phenolic with steel backing washers

2.10 TRANSITION FITTINGS

A. Plastic-to-Metal Transition Fittings:
1. For pipe sizes NPS 2 and smaller: PVC or CPVC, Schedule 80, one-piece fitting; one end with threaded brass insert, and one solvent-cement socket or threaded end.
2. For pipe sizes larger than NPS 2: Flanged joints, provide ductile iron back up flange for plastic pipe.

B. Fitting-Type Transition Couplings:
1. Manufactured piping coupling or specified piping system fitting.

C. HDPE-to-Steel Transition Fittings:
1. For all pipe sizes: Provide HDPE flanged adaptor, with ductile iron back-up ring.

2.11 GATE VALVES

A. Up to and Including Pipe Size NPS 2:
1. Class 125, RS bronze gate valves:
a. Standard: MSS SP-80, Type 2.
b. CWP Rating: 300 psig.
c. Body Material: ASTM B 62, bronze with integral seat and union bonnet.
d. Ends: Threaded.
e. Stem: Bronze.
f. Disc: Solid wedge; bronze.
g. Packing: Asbestos free.
h. Handwheel: Malleable iron

B. Pipe Size NPS 2-1/2 and Over:
1. Class 150, OS&Y steel gate valves:
a. Standard: MSS SP-70, Type I.
b. NPS 2-1/2 to NPS 14, CWP Rating: 300 psig.
c. Body Material: ASTM A 216 grade WCB, cast steel bolted bonnet.
d. Ends: Flanged.
e. Trim: API Trim 8 with Stellite 6 faced carbon steel seat.
f. Disc: Flexible wedge, ASTM A 217 – CA 15.
g. Packing and Gasket: Asbestos free, spiral wound.
h. Stem: ASTM 276-410 stainless steel.

2.12 GLOBE OR ANGLE VALVES

A. Up to and Including 2 Inches:
1. Class 150, bronze globe valves, and bronze disc:
a. Standard: MSS SP-80, Type 1.
b. CWP Rating: 300 psig.
c. Body Material: ASTM B 62, bronze with integral seat and union bonnet.
d. Ends: Threaded.
e. Stem: Bronze, replaceable seat. Rising stem.
f. Packing: Asbestos free.
g. Handwheel: Malleable iron.

B. Over 2 Inches:
1. Class 150, OS&Y iron globe valves
a. Standard: MSS SP-85, Type I.
b. CWP Rating: 300 psig.
c. Body Material: ASTM A 216, grade WCB cast steel with bolted bonnet.
d. Ends: Flanged.
e. Trim: API Trim 8 with Stellite 6 faced carbon steel seat.
f. Disc: ASTM A217-CA15.
g. Stem: ASTM A2776-410 stainless steel.
h. Packing and Gasket: Asbestos free, spiral wound.

2.13 BALL VALVES

A. For Chilled Water Up to and Including pipe size NPS 2:
   1. Manufactures:
      a. Apollo with Therma-Seal insulating tee handle.
      b. Kitz with ISE (insulated stem extension).
      c. Nibco T585-70-66-NS NIB-Seal.
      d. Nexus: (with insulated valve stem) approved for use in conditioned spaces only; field insulate top of valve stem.
   2. Two-piece, full port vented ball with bronze or forged bronze body, blowout proof stem, ASTM A276, Type 316 stainless steel ball, stem, and handle nut; reinforced PTFE packing, thrust washer and seat ring, lever handle with balancing memory stops, solder, or threaded ends. Pressure/temperature to match service requirements, but no less than 250 psig at 250-degree F, SW. 600 psig, CWP. Insulated valve handle extension to clear insulation.

2.14 PLUG VALVES

A. Up to and Including 2 Inches:
   1. Bronze body, bronze tapered plug, full port opening, non-lubricated, Teflon packing, threaded ends.
   2. Operator: One plug valve wrench for every ten plug valves minimum of one.

B. Over 2 Inches:
   1. Cast iron body and plug, full port opening, pressure lubricated, Teflon packing, flanged ends.
   2. Operator: Each plug valve with a wrench with set screw.

2.15 BUTTERFLY VALVES – RESILIENT SEATED

A. Manufacturers: Subject to compliance with specifications as noted herein, provide products by one of the following:
   1. ABZ Valve Model 397.
   2. Centerline Model A2-021-05.
   3. Demco Model NE-C.
   4. Kitz Model 6122E or 6123E.
   5. Mueller Model 88.

B. Standard: MSS-67, Type 1.

C. Body: Class 150 ductile iron, lug pattern, extended neck design to allow for 2” minimum insulation.

D. Liner/Seat: Valves shall be provided with molded-in EPDM liner, bonded and fused to the valve body and hard backed cartridge seat. Liner shall be non-collapsible and stretch resistant to eliminate failure in either pressure or vacuum service, in a design that eliminates possible leakage between body and liner. Valves shall provide full rated dead-end service from 150 pisg to vacuum to 28-inches mercury without the need for a flange on the downstream side.

E. Disc Material: Aluminum bronze.

F. Stem: 410 or 416 stainless steel in order to eliminate leak paths and possible turbulence in flow, stem shall have molded O-ring seals and shall be of the snap ring encapsulated, blowout proof design. Stem to disc engagement shall be of the internally driven design to provide rigid connection between components and eliminate failure under high vibration service. Stem to disc connection via pins, bolts or any external device shall be unacceptable.

G. Packing: EDPM V-type packing shall be utilized in a packing retention design that allows for self-adjustment of packing, eliminate stem leakage and protect around the stem area.

H. Shut Off: Valves shall be certified bubble tight and shall be rated as follows:
1. Valves pipe size NPS 2 to 12 shall be rated to a minimum 200 psi shut off/dead end service.
2. Valves pipe size NPS 14 to 36 shall be rated to a minimum 150 psi shut off/dead end service.

I. Operator: Infinite position locking lever handle shall be provided on valves NPS 4 and smaller. On valves NPS 6 and larger, a worm-gear drive with handwheel shall be included with visual position indicator (MDPI) and shall provide for a positive stop on input shaft to allow for balancing of flow.

J. Valves shall be suitable for 250º F hydronic service.

2.16 BALL VALVES – DIRECT BURIAL

A. Manufacturers: Subject to compliance with Specifications as noted herein, provide product by one of the following:
1. Flowserve Corporation.
2. Vexve Armatury Group

B. Description: Completely insulated and jacketed long-stem, reduced bore ball valves for direct bury application.
1. Body:
a. DN 25–500 Steel, P235GH (1.0345).
b. DN 600–800 Steel, P355 NL1 (1.0566)/ GP240GH (1.0619).
2. Ball:
a. DN 25–600 Stainless steel, X5CrNi18-10 (1.4301).
b. DN 700–800 Steel + stainless plating, ASTM A350 LF2+Ni.
3. Stem: Stainless steel, X8CrNiS18-9 (1.4305).
4. Top of stem: Stainless steel, X5CrNi18-10 (1.4301).
5. Stem seals: FPM.
6. Ball seals: PTFE+C.
7. Equipment: unpainted.
8. Operation: equipped with angle gear, standard hexagon adapter.

C. Insulated and jacketed by Underground Piping System manufacturer.
1. Insulation shall be foam polyurethane or polyisocyanurate and outer jacketing shall be High Density Polyethylene (HDPE).

D. Valve Operator: Angle gear on top, operated with extended T-Key

E. Comply with AWWA M44 for cast iron valve boxes. Include top section, telescopic adjustable extension of length required for depth of burial vale, plug with lettering “CHW” approximately 5-inches in diameter and bottom section with base that fits over valve with barrel.

F. Operating wrenches: Steel, tee handle with one pointed end and socket to match valve operating nut. Length as required to reach deepest buried valve.

2.17 SWING CHECK VALVES

A. Up to and Including NPS 2:
1. Manufactures:
a. Grinnell: Model 3600.
b. Crane.
c. Milvco.
2. Bronze body, bronze trim, bronze rotating swing disc, with composition disc, spring loaded threaded ends, 125 psig WIG.

B. NPS 2 and Larger:

1. Iron body cast steel with bolted cap, bronze trim, bronze, or bronze faced rotating swing disc, renewable disc and seat, flanged ends.
2. Check valve in chilled water decoupler line between the primary and secondary piping loops, to have external indicator.

2.18 AUTOMATIC TEMPERATURE CONTROL VALVES, ACTUATORS, AND SENSORS

A. Comply with requirements specified in Section 230900 "HVAC Instrumentation and Controls."

2.19 WATER TREATMENT FOR CLOSED LOOP SYSTEMS

A. Manufacturers:
1. Chem-Aqua
2. Garratt Callahan
3. Guardian – IPCO, Inc.
4. Nalco Company
5. Triple Point

B. Combination Bypass Feeder and Filter Bag:
1. Manufacturers: Subject to compliance with requirements, provide product by one of the following:
   a. Neptune FTF-5HP with legs and filter bags
2. Steel, with corrosion-resistant exterior coating, minimum 3-1/2-inch (89-mm) fill opening in the top, and NPS 3/4 (DN 20) bottom inlet and top side outlet. Quarter turn or threaded fill cap with gasket seal and diaphragm to lock the top on the feeder when exposed to system pressure in the vessel.
3. Capacity: 7.5 gal.
4. Minimum Working Pressure: 125 psig.
5. 5-micron cleanable bag filter.

C. Water Meter:
1. Manufacturers: Subject to compliance with requirements, provide product by one of the following:
   a. Hersey Measurement Company.
   b. Neptune Technology Group: Model T-10.
2. Description: Nutating disc, positive displacement water meter.
   a. Housing: Corrosion-resistant, no-lead high copper alloy.
   b. Register: Magnetic, low torque, impact.
   c. Connections: Threaded.
3. Size: 5/8", unless noted otherwise in Drawings.

D. Chemicals: Specially formulated, based on analysis of makeup water, to prevent bacteria growth and the accumulation of scale and corrosion in piping and connected equipment.

PART 3 - EXECUTION

3.1 PIPE INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicate piping locations and arrangements if such were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination or Shop Drawings.

B. Select system components with pressure rating equal to or greater than system operating pressure.

C. Remove scale and dirt on inside and outside before assembly.

D. Keep open ends of pipe free from scale and dirt. Protect open ends with temporary plugs or caps.

E. Route piping in orderly manner, parallel to building structure, and maintain gradient.

F. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

G. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

H. Install piping to conserve building space and not interfere with use of space.

I. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

J. Install piping to permit valve servicing.

K. Group piping whenever practical at common elevations.

L. Slope piping at indicated slopes and arrange to drain at low points.

M. Install piping free of sags and bends.

N. Install drains, consisting of a tee fitting, NPS ¾ ball valve, and hose end connection with cap, at low points in piping system mains and elsewhere as required for system drainage.

O. Install fittings for changes in direction and branch connections. No mitering or notching for fittings permitted, except as noted below:
   1. Steel Butt Welded Pipe:
      a. For changes in direction of 15 degrees or less, pipe may be mitered.
      b. For change in direction greater than 15 degrees, standard elbow shall be cut to form the required odd angle elbow.
   2. Steel Pipe Branch Connections for Hydronic Piping:
      a. Branch NPS 4 and smaller and at least two pipe sizes smaller than the main, weldolets, threadolets, and sockolets are allowed.
      b. Branch NPS 6 and larger and at least two pipe sizes smaller than the main, sweepolets are allowed.

P. Reduce pipe sizes using eccentric reducer fitting installed with flat side up.

Q. Install piping to allow application of insulation.

R. Install piping to allow for expansion and contraction without stressing pipe, joints, or connected equipment.

S. Provide access doors where valves and fittings are not exposed. Comply with requirements for building access doors specified in Section 230053 “Basic HVAC Materials and Methods.”

T. Install unions in piping, NPS 2 and smaller, adjacent to automatic valves, pressure reducing valves, at final connections of equipment, and elsewhere as indicated.

U. Install flanges in piping, NPS 2-1/2 and larger, at final connections of equipment and elsewhere as indicated.

V. Install sleeves for piping penetrations of walls, ceilings, and floors as specified in Section 230053 “Basic HVAC Materials and Methods.”

W. Install escutcheons for piping penetrations of walls, ceilings, and floors in exposed finished spaces. Comply with requirements for escutcheons specified in Section 230053 “Basic HVAC Materials and Methods.”

X. Identify piping as specified in Section 230077 “Identification for HVAC Piping and Equipment.”

Y. Install air vents at all high points in piping, at heat-transfer coils, and elsewhere as required for system air venting as specified in Section 232114 "Hydronic Specialties."

Z. Where pipe support members are welded to structural building framing, scrape, brush clean, and apply one coat of zinc-rich primer to welds.

AA. Prepare and paint uninsulated pipe, fittings, supports, and accessories, ready for finish painting. Refer to Division 09 Sections "Interior Painting" and "Exterior Painting" for requirements.

3.2 INSTALLATION – UNDERGROUND PRE-INSULATED AND CLADDED PIPING SYSTEMS

A. Underground systems shall be buried in a trench not less than three feet deeper than the top of the pipe. A minimum thickness of 24-inches compacted backfill placed over the top of the pipe.

B. Comply with requirements of Section 312000 "Earth Moving"" and other Division 31 site construction Sections and trench details on Civil Drawings.

C. Trench bottom shall have a minimum of 6-inches of sand. All field cutting of the pipe shall be performed in accordance with the manufacturer's installation instructions.

D. The interior of all pipe, fittings, valves, and accessories shall be kept free from dirt and foreign material. Suitable bulkheads shall be used to block or plug ends of piping at the close of each workday and when work on a particular section of the piping is temporarily discontinued. Should dirt, mud, concrete, or other foreign materials be allowed to enter the piping, such piping shall immediately be cleaned.

E. Each length or section of pipe shall be cleaned immediately before being placed in the trench and joined. Cleaning shall be accomplished by using a tight swab or other suitable cleaning device. Pipe ends shall be wiped clean immediately before the pipe is joined.

F. A hydrostatic pressure test of the carrier pipe shall be performed at one-half times the normal system operating pressure for not less than two hours.

G. Underground piping, joints, and fittings shall not be insulated prior to hydrostatic, or leak testing, of piping system and inspection by Owner's Representative.

H. Underground joints and fittings shall not be backfilled prior to pressure test on closure system and inspection by Owner's Representative.

I. Field Service shall be provided by a certified manufacturer's representative or company field service technician. The technician will be available at the job for a minimum of one day (or more if required by job size) to check unloading, storing, and handling of pipe, pipe installation, pressure testing, field joint insulation, and backfilling techniques.

3.3 HANGERS AND SUPPORTS

A. Hanger, support, and anchor devices are specified in Section 230062 "Hangers for HVAC Piping and Equipment."

B. Pipe Hanger Spacing pipe hanger spacing and hanger rod sizing requirements are specified in Section 230062 "Hangers for HVAC Piping and Equipment."

C. For insulated piping, provide insulation inserts and shields as specified in Section 230712 "HVAC Systems Insulation."

D. For insulated, strut-mounted copper pipe (NPS 1/4 to 4), provide Insulation Couplings per the requirements of Section 230062 "Hangers and Supports for HVAC Piping and Equipment."

E. Provide copper-clad hangers and supports for hangers and supports in direct contact with copper pipe.

3.4 PIPE JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burs. Bevel plain ends of steel pipe.

B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

C. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.

D. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.

E. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.

F. Welded Joints: Construct joints according to AWS D10.12/D10.12M, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

G. Flanged Joints:
   1. Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.
   2. 125 Pound Cast Iron Flange (Plain Face): Mating flange shall have raised face, if any, removed to avoid overstressing the cast iron flange.

3.5 DIELECTRIC FITTING INSTALLATION

A. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing in wet piping systems. **Do not use dielectric unions**.

B. Dielectric Fittings for NPS 2 and Smaller: Use dielectric nipples.

C. Dielectric Fittings for NPS 2-1/2 and Larger: Use dielectric flange kits.

3.6 VALVE APPLICATIONS

A. Install shutoff-duty valves at supply and return connections to each piece of equipment and elsewhere as indicated.

B. Install check valves at each pump discharge and elsewhere as required to control flow direction.

C. If valve applications are not indicated on the Drawings, use the following:
   1. Shutoff Service: Ball, butterfly valves.
   2. Butterfly Valve Dead-End Service: Single-flange (lug) type.
   3. Throttling Service: Globe, ball, or butterfly valves.
   4. Pump-Discharge Check Valves:
      a. NPS 2 and Smaller: Bronze swing check valves with bronze disc.
      b. NPS 2-1/2 and Larger: Iron swing check valves with spring or iron, center-guided, resilient-seat check valves.

D. Install safety valves at hot-water generators and elsewhere as required by ASME Boiler and Pressure Vessel Code. Pipe outlet without valves to the drain to nearest floor drain or as indicated on Drawings. Comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, for installation requirements.

E. Install pressure-reducing valves at makeup-water connection to regulate system fill pressure.

3.7 TERMINAL EQUIPMENT CONNECTIONS

A. Make connections according to the following, unless otherwise indicated:
   1. Install unions, in piping NPS 2 and smaller, adjacent to each valve control valve and at final connection to each piece of equipment.
   2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.

B. Wet Piping Systems: Install dielectric fittings to connect piping materials of dissimilar metals.

C. Sizes for supply and return piping connections shall be the same as or larger than equipment connections.

D. Install control valves in accessible locations close to connected equipment.

E. Install ports for pressure gages and thermometers at coil inlet and outlet connections according to Section 230122 "Meters and Gages."

3.8 VALVE INSTALLATION

A. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.

B. Locate valves for easy access and provide separate support where necessary.

C. Install valves in horizontal piping with stem at or above center of pipe, not inverted.

D. Install valves in position to allow full stem movement.

E. Install chainwheels on operators for butterfly, gate, globe, and plug valves NPS 4 and larger and more than 96 inches above floor. Extend chains to 80 inches above finished floor.

F. Install check valves for proper direction of flow and as follows:
   1. Swing Check Valves: In horizontal position with hinge pin level.
   2. Center-Guided Check Valves: In horizontal or vertical position, between flanges.

3.9 INSTALLATION – DIRECT BURIAL BALL VALVES

A. Install valves per manufacturer's instructions.

3.10 PIPE CLEANING AND FLUSHING

A. Keep pipe clean and free of dirt. Keep caps on ends of pipe, or covered with 6-mil plastic, when it is stored on site and reinstall caps on ends of installed piping at the end of each day.

B. On bench work making up fittings and when installing fittings, wipe slag out of ends of pipe where accessible from the open end.

C. Tap and bump long pieces of pipe to knock loose welding slag inside pipe out of the open end.

D. Prior to closing up piping system, piping shall be flushed, blown, or pigged as necessary to provide clean systems.

E. Underground Piping System – Additional Requirements:
   1. Contractor to submit a piping cleaning plan, process, and schedule for cleaning the underground piping system.
      a. Coordinate flushing and cleaning process with Commissioning Authority.
   2. Contractor to provide temporary pipe, fitting and pumps as required.
   3. Pump circulation rate (gpm) to be as recommended by Chemical Treatment Supplier.

4. Pipes shall be flushed to low points.

F. When flushing and cleaning the pipe, provide a bypass at coils (air handlers, fan coil units, air terminal units, etc.) and heat exchangers (includes brazed, shell-in-tube or plate and frame heat exchangers at packaged air-cooled chillers and self-contained water-cooled AC unit, etc.) with full size hoses or PVC pipe until cleaning process is complete.

G. Complete flush and cleaning of piping system as directed by chemical treatment and Commissioning Agent technician, being certain to keep strainers clean and removing start-up strainers at pumps after pipe cleaning is complete.

H. When connecting new pipe to existing system, provide temporary pump, piping, valves, cartridge filter (5 microns), and one-shot chemical feeder. New piping system to be flushed, cleaned, and treated prior to opening to existing piping system.

3.11 FIELD QUALITY CONTROL

A. Leave joints, including welds, uninsulated and exposed for examination during test.

B. Perform the following tests on hydronic piping:
1. Use ambient temperature water as a testing medium unless there is risk of damage due to freezing.
2. While filling system, use vents installed at high points of system to release air. Use drains installed at low points for complete draining of test liquid.
3. While filling system, use vents installed at high points of system to release air. Use drains installed at low points for complete draining of test liquid.
4. Isolate expansion tanks and determine that hydronic system is full of water.
5. Subject piping system to hydrostatic test pressure that is not less than 1.5 times the system's working pressure. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength or 1.7 times "SE" value in Appendix A in ASME B31.9, "Building Services Piping."
6. Duration: 6 hours without evidence of leakage.
7. Correct or replace defective workmanship or materials shown by tests and retest as necessary to insure tightness.
8. Prepare written report of testing.

C. Perform the following before operating the system:
1. Open manual valves fully.
2. Inspect pumps for proper rotation.
3. Set makeup pressure-reducing valves for required system pressure.
4. Inspect air vents at high points of system and determine if all are installed and operating freely (automatic type), or bleed air completely (manual type).
5. Set temperature controls so all coils are calling for full flow.

3.12 WATER TREATMENT FOR ALL CLOSED LOOP SYSTEMS

A. General:
1. Water treatment chemical supplier for thermal water piping systems shall work with the Contractor to ensure that all thermal water piping and HVAC systems are properly flushed, cleaned, and passivated.
2. Install water meter in the make-up water line serving each closed loop piping system.
3. After completion of installation and leak test, fill, clean/flush and treat system.
4. Prepare, and submit for approval, pipe flushing, cleaning and treatment plan. Commissioning Authority shall approve plan and witness process.

B. Pipe Cleaning:
   1. Install combination bypass filter and chemical feeder in a bypass circuit around the circulation pumps, unless otherwise indicated on the Drawings.
   2. Coordinate with Mechanical Contractor to provide required bypass piping, valves, etc. prior to flushing and cleaning of piping systems.
      a. Provide bypass piping around all coils and control valves prior to fill and flush operation.
      b. Provide spool pieces in place of all inline flow meters during testing, cleaning, and flushing operations.
   3. Start pipe cleaning process with 50-micron filters and move down to 25-micron filters as system is cleaned. Final filters shall be 5-micron.
   4. Provide temporary crossovers and temporary pumps as required for cleaning new work before valves at connections to existing work are opened. Minimum cleaning flow rates to provide water velocity of 4 feet per second.

Minimum Cleaning Water Flows	
Pipe Size (NPS)	Flow (GPM)
4	150

C. Perform an analysis of makeup water to determine type and quantities of chemical treatment needed to keep system free of scale, corrosion, and fouling.

D. Fill system with fresh water and add liquid alkaline compound with emulsifying agents and detergents to remove grease and petroleum products from piping. Circulate solution for a minimum of 24 hours, drain, clean strainer screens, and refill with fresh water.

E. After initial flushing and cleaning, open coils up to system, complete cleaning, and addition of biocide.

F. Underground Piping System – Additional Requirements:
   1. Pipe shall be flushed and treated no more than one week after initial cleaning.

G. Water treatment provider shall provide a minimum of twice weekly service and analysis during the first two weeks after start-up and a minimum of monthly service for the first year after Substantial Completion. Service visits to include chemical analysis of closed loop systems, adjusting chemistry as required and changing dirty cartridge filters and blowing down the air dirt separator. Provide Owner with written report of findings and/or actions taken during the monthly service visits.
   1. Initial blow downs of air/dirt separator to be into a barrel until most of the dirt/trash are removed. (Do not pour dirt down the floor drain.)

END OF SECTION 23 2113

SECTION 23 2114

HYDRONIC SPECIALTIES

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Expansion tanks.

B. Air control devices.

C. Air and dirt separators.

D. Strainers.

E. Pump suction fittings.

F. Venturi flow meter.

G. Hose kits.

H. Relief valves.

I. Flexible connections.

J. Venturi balancing valve.

1.2 RELATED SECTIONS

A. Section 230900 “HVAC Instrumentation and Controls” for Automatic Temperature-Control Valves and Actuators.

1.3 DEFINITIONS

A. Branch Line: As related to the requirements for installing automatic versus manual air vents, a branch line is any runout that services only one terminal unit.

1.4 ACTION SUBMITTALS

A. Product Data: Provide product data for manufactured products and assemblies required for this project. Include component sizes, rough-in requirements, service sizes, and finishes. Include product description, model, and dimensions.

1.5 INFORMATIONAL SUBMITTALS

A. Operation and Maintenance Data: For air control devices and hydronic specialties, s to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE

A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.

B. Fabricate and stamp air separators and expansion tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

PART 2 - PRODUCTS

2.1 BLADDER-TYPE EXPANSION TANKS

A. Manufacturers: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
   1. Armstrong.

2. Bell & Gossett.
3. Elbi of America.
4. Taco.
5. Wheatley.

B. Tank: Welded steel, rated for 125-psig working pressure and 375 deg F maximum operating temperature. Factory tested, precharge with taps fabricated and supports installed and labeled according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

C. Bladder: flexible heavy-duty butyl bladder (removable). Securely sealed into tank to separate air charge from system water to maintain required expansion capacity.

D. Steel support stand for floor mounted units.

E. Accessories: Air-charging fitting; precharge to 12 psig.

F. Automatic Cold-Water Fill Assembly: Pressure reducing valve, check valve, strainer, and valved bypass.
1. Pressure reducing valve adjustment range to be as required to obtain scheduled expansion tank pressure.

2.2 AIR CONTROL DEVICES

A. Manufacturers: Subject to compliance with requirements, provide one of the following:
1. Armstrong.
2. Elbi of America.
3. Hoffman Model 79.
4. Watson-McDaniel.
5. Wheatley.

B. Manual Air Vents:
1. Body: Bronze.
2. Internal Parts: Stainless Steel Ball.
3. Operator: Lever.
4. Inlet Connection: NPS 1/2.
5. Discharge Connection: NPS 1/4.
6. CWP Rating: 15- psig.
7. Maximum Operating Temperature: 225 deg F.

C. Automatic Float Type:
1. Body: cast iron.
2. Internal Parts: Stainless Steel.
3. Operator: Stainless Steel metal float.
4. Inlet Connection: NPS ½ with ball valve.
5. Discharge Connection: NPS 1/4.
6. CWP Rating: 150-psig.
7. Maximum Operating Temperature: 240 deg F.

2.3 AIR AND DIRT- TYPE SEPARATOR

A. Manufacturers: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
1. Armstrong: DAS-R and DASH-R.
2. Bell & Gossett: CRS.
3. Elbi of America.

4. Spirotherm: Dirt and Drain.
5. Taco.
6. Thrush: Aar-O-Vent.
7. Wessels: Series Wess-Vent.

B. Description: In-line coalescing type air and dirt separator with removable head.
1. Shell: Carbon steel with exterior red oxide primer finish.
a. Inlet and Outlet Connections: Threaded for NPS 2 and smaller; flanged connections for NPS 2-1/2 and larger.
b. Tank: Flanged; ASME constructed and labeled for 150-psig minimum working pressure and 375 deg F maximum operating temperature.
c. Coalescence Media: Integral 304 stainless steel or copper bundle of spiral wound tubes, constructed to direct released air into expansion tank and collect dirt.
2. Blow down connection with bronze ball valve with stainless steel ball and shaft.
3. Skim/flush connection with bronze ball valve with stainless steel ball and shaft.
4. High capacity, float actuated air vent with ball valve isolation valve.
5. Inlet and outlet gauge ports.

C. Rating: Remove 99% of dissolved oxygen and 96% of dirt particles 5-microns and larger.

D. Sizing: Air and dirt separator shall be sized per manufacturer's recommendations. Maximum pressure drop for sizes 2-inch to 12-inch shall not exceed two feet of water for standard velocity units and three feet of water for high velocity units.

2.4 STRAINERS

A. Body 2-inch and smaller:
1. Screwed brass or iron body by 175 psig working pressure, Y pattern with 1/32-inch stainless steel perforated screen.

B. Size 2-1/2-inch to 4 -inch:
1. Flanged iron body for 175 psig working pressure, Y pattern with 3/64-inch stainless steel perforated screen.

C. Strainer Screen: 40-mesh startup strainer. Liquid service 3-inch and smaller, 20 mesh screen, 4-inch and larger, 3/64-inch diameter.

2.5 PUMP SUCTION FITTINGS

A. Manufacturers: Subject to compliance with requirements, provide one of the following:
1. Armstrong.
2. Aurora.
3. Bell & Gossett.
4. Mueller.
5. Taco Model SD.
6. Wheatley Model FD.

B. Fitting: Angle pattern, cast-iron or ductile body, threaded or flanged for 2-inch and smaller, flanged for 2-1/2-inch and larger, rated for 175-psig working pressure, with bronze or stainless-steel straightening vanes, 304 stainless steel cylinder strainer with 3/16-inch diameter openings, bronze disposable fine mesh start-up strainer to fit over bronze or stainless-steel permanent cylinder strainer, and permanent magnet located in flow stream and removable for cleaning.

C. Accessories: Adjustable foot support, blowdown tapping in bottom, gage tapping inside.

2.6 VENTURI FLOW METER

A. Manufacturers: Subject to compliance with requirements, provide one of the following:
   1. Armstrong.
   2. Flow Design.
   3. Gerand.
   4. Presco.
   5. Taco.

B. Venturi Flow Meter: 150 psig WP. Venturi Flow Meter, bronze, screwed 2-inch and smaller; steel, butt-welded in sizes 2-1/2-inch and larger, 3% accuracy over 10:1 range, maximum line pressure drop not exceeding 1-foot. Provide quick connect 1/8-inch MNPT x ¼-inch brass ball valve process connections with 2.5-inch brass extensions. Provide stainless steel ID tag for each meter indicating manufacturer, model, size, design flow, design differential pressure. Submit meter differential pressure vs flow graph.

C. Portable differential pressure meter consisting of case containing 10-foot color coded hoses for low- and high-pressure connections, and connectors suitable for connection to read-out valves.

2.7 HOSE KITS

A. Manufacturers: Subject to compliance with requirements, provide one of the following:
   1. Flow Design, Inc.
   2. Twin City Hose.
   3. Nexus.

B. Hose:
   1. Inner Hose: Fire retardant thermoplastic tube.
   2. Exterior Sleeve: Stainless steel, braided.
   3. Pressure Rating: 600 psig at 230F.
   4. Length: As required for installation: Minimum 12-inches and maximum 24-inches.
   5. Brass End Fittings:
      a. One end fixed male screw.
      b. One end with swivel female with nipple (MxM).
      c. Inverted flare nipple, “washerless design.”

C. Venturi Balancing Valves – See respective articles, this section.

D. Automatic Valve – see Section 230900 “HVAC Instrumentation and Controls.”

2.8 RELIEF VALVES

A. Bronze body, Silicone seat, stainless steel stem and springs, automatic, direct pressure actuated, capabilities ASME certified and labeled.

2.9 FLEXIBLE CONNECTORS

A. Manufacturers: Subject to compliance with requirements, provide one of the following:
   1. Flexonics.
   2. Hypsan.
   3. Keflex.
   4. Southeastern Hose.
   5. Twin City Hose.

B. Laminated 2-ply corrugated 304 stainless steel joints designed for 150 psig WP. Joints shall be flanged and have not less than 5” relaxed face-to-face dimension.

C. For each joint furnish a control unit consisting of tie bolts with required nuts, spacers, washers and stop and lock nuts.

D. All thread rods shall not be used for tie bolts. Nuts and bolts for joints in chilled water lines shall be type 304 stainless steel.

2.10 VENTURI BALANCING VALVE

A. Manufactures: Subject to compliance with requirements, provide one of the following:
1. Flow Design Inc., FlowSet.
   a. Size ½ inch to 2 inch: Model UA-SBS.
   b. Size 2-1/2 inch to 18 inch: Model AF or AW (Model AG (grooved pipe) only allowed when specified under specific piping system).
2. Bell & Gossett.
3. Griswold Controls.
4. Nutech.
5. Nexus.
6. Preso.

B. Design: Manual balancing devices shall be venturi type as defined by ASHRAE. Devices shall have a precision machined throat and have a stated catalog accuracy of 3% full scale. The induced differential reading (flow signal) shall be greater than two feet water column at the design flow with the valve in the wide-open position. The valves are to have differential readout ports fitted with 2" extensions, check valve, and protective cap, and are to have a memory stop to allow complete shut-off and return to set position without losing the setpoint.

C. Construction:
1. All devices, 2" and smaller, shall have a machined brass venturi section and a throttling ball valve with a memory stop on the downstream side of the venture. The ball valve shall have a brass or bronze body, blowout proof stem, type 316 stainless steel ball, stainless steel stem, virgin Teflon seats, brass stem and packing nut and a steel handle.
   a. Thread or sweat connections.
2. Valves 2" and larger, shall have a venturi section and a throttling butterfly valve with a memory stop. Butterfly valve shall meet the specification requirements for ball valves in Section "Hydronic Piping."
   a. Flanged connections.

D. Minimum Ratings:
1. Devices with sweat or NPT connections: 400 PSIG at 250 degrees F.
2. Devices with flanged connections: 200 PSIG at 250 degrees F.

E. Installation:
1. The upstream and downstream straight pipe required to achieve 3% full scale accuracy shall be incorporated as an integral part of the venturi and valve assembly. No additional straight piping shall be required.

F. Accessories:
1. Provide factory fabricated insulation kit with handle cover and accessory extensions.
2. Provide tag attached to each valve with brass or stainless-steel chain indicating the following:
   a. Manufacturer.
   b. Size and model.
   c. Differential pressure at design flow.
3. Submit with flow versus differential pressure drop for each valve size with Closeout Documents.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install specialties in accordance with manufacturer's instructions.

B. Air Vents:
   1. In piping mains, provide automatic air vents at piping high points and as indicated on the Drawings.
      a. For automatic air vents, provide 1/4-inch, Type L soft copper vent tubing to nearest drain.
   2. In piping branches and at heat-transfer coils, provide manual air vents at piping high points and as indicated on the Drawings.

C. Air Eliminator and Dirt Separators:
   1. Provide full port stainless-steel ball valves at blow down and flush/skim connections, if not provide with unit.
   2. Pipe blow down and flush/skim valves line size to floor drain.
   3. Pipe air vent outlet with ¼-inch copper tube to floor drain.
   4. Provide inlet and outlet valves to isolate unit, with a line-size, valved bypass around separator.
   5. Install unit to allow sufficient clearance below unit to remove coalescing media when bottom cover is removed.
   6. Upon initial start-up, the blow down and skim valves should be operated frequently.
   7. Provide pressure gauge with valved taps at inlet and outlet pipe.

D. Install strainers on inlet side of each control valve, pressure-reducing valve, solenoid valve, in-line pump, and elsewhere as indicated. Install NPS ¾ nipple and ball valve with hose end connection in blowdown connection of strainers.

E. Support pump fittings with floor mounted pipe and flange supports.

F. Relief Valves:
   1. Provide relief valves on heat exchangers.
   2. Select system relief valve capacity so that it is greater than make-up pressure reducing valve capacity. Select equipment relief valve capacity to exceed rating of connected equipment.
   3. Pipe relief valve outlet to nearest floor drain.
   4. Where one line vents several relief valves, make cross sectional area equal to sum of individual vent areas.

G. Hose Kits: Install without loops or excess length and so that hose is not under tension or compression forces.

END OF SECTION 23 2114

SECTION 23 3113

METAL DUCTS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes metal ducts for supply, return, outside, and exhaust air-distribution systems in pressure classes from minus 2- to plus 10-inch wg. Metal ducts include the following:
   1. Sheet metal materials.
   2. Single-wall rectangular ducts and fittings.
   3. Single-wall round and flat-oval ducts and fittings.
   4. Sealants and gaskets.
   5. Hangers and supports.

1.2 RELATED SECTIONS

A. Section 230553 “Identification for HVAC Piping and Equipment” for labeling requirements for fire dampers, smoke dampers, and duct access doors.

B. Section 230593 “Testing, Adjusting and Balancing” for testing, adjusting, and balancing for metal ducts.

C. Section 230712 “HVAC Systems Insulation” for duct liner requirements.

D. Section 233300 “Duct Accessories” for dampers, sound-control devices, duct-mounted access doors and panels, turning vanes, and flexible ducts.

1.3 PERFORMANCE REQUIREMENTS

A. Delegated Duct Design: Duct construction, including sheet metal thicknesses, seam and joint construction, reinforcements, and hangers and supports, shall comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" and performance requirements and design criteria indicated in "Duct Schedule" Article.

B. Structural Performance: Duct hangers and supports shall withstand the effects of gravity loads and stresses within limits and under conditions described in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

C. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of the following products:
   1. Sealants and gaskets.

B. Shop Drawings: Drawn to 1/4-inch equals 1-foot scale.
   1. Fabrication, assembly, and installation, including plans, elevations, sections, components, and attachments to other work.
   2. Factory-and shop-fabricated ducts and fittings.
   3. Duct layout indicating sizes, configuration, liner material, seal classification, and static-pressure classes.
   4. Elevation of bottom of ducts.
   5. Dimensions of main duct runs from building grid lines.
   6. Fittings.
   7. Reinforcement and spacing.

8. Seam and joint construction.
9. Penetrations through smoke barriers and fire-rated construction.
10. Equipment installation based on equipment being used on Project.
11. Locations for duct accessories, including access doors and dampers.
12. Hangers and supports, including methods for duct and building attachment.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Plans, drawn to a scale large enough to indicate and resolve conflicts, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
   1. Duct installation in congested spaces, indicating coordination with general construction, building components, and other building services including:
      a. Suspended ceiling components.
      b. Other systems installed in same space as duct.
      c. Ceiling and wall mounting access doors and panels required to provide access to dampers and other operating devices.
      d. Ceiling mounting items, including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.
   2. Indicate proposed changes to duct layout.
   3. Provide Coordination Drawings for the following areas:
      a. Mechanical Room.

B. BIM: Provide a 3D BIM model to indicate and resolve conflicts in which the following items are shown and coordinated based on input from installers of the items involved:
   1. Duct installation indicating coordination with general construction, building components, and other building services including:
      a. Suspended ceiling components.
      b. Other systems installed in same space as duct.
      c. Ceiling and wall mounting building access doors and panels required to provide access to dampers and other operating devices.
      d. Ceiling mounting items, including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.
   2. Indicate proposed changes to duct layout.

1.6 QUALITY ASSURANCE

A. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and System Start-up."

B. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6.4.4 - "HVAC System Construction and Insulation."

PART 2 - PRODUCTS

2.1 SHEET METAL MATERIALS

A. General Material Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

B. Where ductwork is indicated to be exposed to view in occupied spaces, provide materials which are free from visual imperfections, including pitting, dents and other imperfections including those which would impair post painting.

C. Galvanized Sheet Steel: Comply with ASTM A 653/A 653M.
   1. Galvanized Coating Designation: G90.
   2. Finishes for Surfaces Exposed to View: “Paint Grip” steel - Mill phosphatized or galvanealed.

D. Carbon-Steel Sheets: Comply with ASTM A 1008/A 1008M, with oiled, matte finish for exposed ducts.

E. Stainless Steel: Comply with ASTM A 480/A 480M, Type 304 or 316, as indicated in the Part 3 "Duct Schedule" Article; cold rolled, annealed, sheet. Exposed surface finish shall be No. 2B finish for concealed ducts and No. 4 finish for exposed ducts.

F. Aluminum Sheets: Comply with ASTM B 209 Alloy 3003, H14 temper; with mill finish for concealed ducts, and standard, one-side bright finish for duct surfaces exposed to view.

G. Reinforcement Shapes and Plates: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized where installed on galvanized sheet metal ducts.
   1. Where black- and galvanized-steel shapes and plates are used to reinforce aluminum ducts, isolate the different metals with butyl rubber, neoprene, or EPDM gasket materials.

H. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 900 mm 36 inches.

2.2 SINGLE-WALL RECTANGULAR DUCTS AND FITTINGS

A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" based on indicated static-pressure class unless otherwise indicated.

B. Transverse Joints: Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-1, "Rectangular Duct/Transverse Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible.”

C. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-2, "Rectangular Duct/Longitudinal Seams," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible.”

D. Elbows, Transitions, Offsets, Branch Connections, and Other Duct Construction: Select types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 4, "Fittings and Other Construction," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible.”

E. Duct sizes shown on the Drawings are clear inside dimensions without an allowance for insulation.

2.3 SINGLE-WALL ROUND AND FLAT-OVAL DUCTS AND FITTINGS

A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 3, "Round, Oval, and Flexible Duct," based on indicated static-pressure class unless otherwise indicated.

B. Manufacturers: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
   1. Eastern Sheetmetal.
   2. Linx Industries, Inc.
   3. McGill AirFlow LLC.
   4. SEMCO Incorporated.
   5. Sheet Metal Connectors, Inc.

6. Spiral Systems., Inc.

C. Flat-Oval Ducts: Indicated dimensions are the duct width (major dimension) and diameter of the round sides connecting the flat portions of the duct (minor dimension).

D. Transverse Joints: Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-1, "Round Duct/Transverse Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
1. Transverse Joints in Duct Larger than 60 Inches in Diameter: Flanged.

E. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-2, "Round Duct/Longitudinal Seams," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
1. Fabricate round ducts larger than 90 inches in diameter with butt-welded longitudinal seams.
2. Fabricate flat-oval ducts larger than 72 inches in width (major dimension) with butt-welded longitudinal seams.

F. Tees and Laterals: Select types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-5, "90 Degree Tees and Laterals," and Figure 3-6, "Conical Tees," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

G. Fabricate elbows using die-formed, gored, or mitered construction. Bend radius of die-formed, gored, and pleated elbows shall be 1-1/2 times duct diameter unless noted otherwise on drawings. Unless elbow construction type is indicated, fabricate elbows as follows:
1. Mitered-Elbow Radius and Number of Pieces: Welded construction complying with SMACNA's "HVAC Duct Construction Standards-Metal and Flexible," Table 3-1 "Mitered Elbows." Elbows with less than 90-degree change of direction have proportionately fewer segments unless otherwise indicated.
   a. Elbows 12-inches and Smaller in Diameter: Stamped.
   b. Elbows 14-inches and Larger in Diameter: Welded

2.4 SEALANT AND GASKETS

A. General Sealant and Gasket Requirements: Surface-burning characteristics for sealants and gaskets shall be a maximum flame-spread index of 25 and a maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.

B. Water-Based Joint and Seam Sealant:
1. Application Method: Brush on.
2. Solids Content: Minimum 65 percent.
3. Shore A Hardness: Minimum 20.
4. Water resistant.
5. Mold and mildew resistant.
6. VOC: Maximum 75 g/L (less water).
7. Maximum Static-Pressure Class: 10-inch wg, Plus and Minus.
8. Service: Indoor or outdoor.
9. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum sheets.

C. Solvent-Based Joint and Seam Sealant:
1. Application Method: Brush on.

2. Base: Synthetic rubber resin.
3. Solvent: Toluene and heptane.
4. Solids Content: Minimum 60 percent.
5. Shore A Hardness: Minimum 60.
6. Water resistant.
7. Mold and mildew resistant.
8. For indoor applications, sealant shall have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
9. VOC: Maximum 395 g/L (less water).
10. Maximum Static-Pressure Class: 10-inch wg, Plus and Minus.
11. Service: Indoor or outdoor.
12. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum sheets.

D. Flanged Joint Sealant:
1. General: Single-component, acid-curing, silicone, elastomeric.
2. Type: S.
3. Grade: NS.
4. Class: 25.
5. Use: O.
6. For indoor applications, sealant shall have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

E. Flange Gaskets: Butyl rubber, neoprene, or EPDM polymer with polyisobutylene plasticizer.

F. Round Duct Joint O-Ring Seals:
1. Seal shall provide maximum leakage class of0.14 L/s per sq. m at 250 Pa 3 cfm/100 sq. ft. at 1-inch wg and shall be rated for 10-inch wg static-pressure class, Plus or Minus.
2. EPDM O-ring to seal in concave bead in coupling or fitting spigot.
3. Double-lipped, EPDM O-ring seal, mechanically fastened to factory-fabricated couplings and fitting spigots.

2.5 HANGERS AND SUPPORTS

A. Hanger Rods for Noncorrosive Environments: Cadmium-plated steel all-thread rods and nuts.

B. Hanger Rods for Corrosive Environments: Electrogalvanized, all-thread rods or galvanized rods with threads painted with zinc-chromate primer after installation.

C. Strap and Rod Sizes: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1, "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct."

D. Steel Cables for Galvanized-Steel Ducts: Galvanized steel complying with ASTM A 603.

E. Steel Cables for Stainless-Steel Ducts: Stainless steel complying with ASTM A 492.

F. Steel Cable End Connections: Cadmium-plated steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.

G. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.

H. Trapeze and Riser Supports:
1. Supports for Galvanized-Steel Ducts: Galvanized-steel shapes and plates.
2. Supports for Stainless-Steel Ducts: Stainless-steel shapes and plates.

3. Supports for Aluminum Ducts: Aluminum, or galvanized steel coated with zinc chromate.

I. Roof Mounted Supports:
1. Duct support systems installed on roof shall be equal to Cooper B-Line: Dura-Block system of plastic bases supports and strut frames.
2. Bases: Injection molded and pressed, plastic and rubber. Bases shall be 18-inch x 18-inch, shop fabricated with inserts for square tubing or threaded rods as required.
3. Framing: 1-5/8-inch or 1-7/8-inch galvanized strut fabricated of steel conforming to ASTM A570, Grade 33. Framing shall be roll formed of 12-gauge steel 3 sided or tubular shaped. Tubing shall be perforated with 9/16-inch holes at 1 7/8-inch centers on 3 sides.
4. Accessories: Provide all clamps, bolts, nuts, washers, and other devices as required for a complete system.
5. Strut Coatings:
   a. Shall be hot dip galvanized. Galvanizing shall conform to ASTM A123 for tubing and ASTM A153 for hardware and accessories, or
   b. High-performance factory applied electro-deposition acrylic coating Unistrut Perma-Green III, electro-deposition epoxy coating Dura Green by Eaton/Cooper B-Line, or approved equivalent.

J. Refer to Section 230529 “Hangers and Supports for HVAC Piping and Equipment,” for additional requirements.

PART 3 - EXECUTION

3.1 DUCT CLEANLINESS

A. Protect duct interiors from moisture, construction debris and dust, and other foreign materials. Comply with SMACNA's "IAQ Guidelines for Occupied Buildings Under Construction," Appendix G, "Duct Cleanliness for New Construction Guidelines" and the following:
1. Delivery to Site:
   a. Prevent damage during transportation and off-loading
   b. All duct shall be sealed either by blanking or capping duct ends, bagging small fittings, surface wrapping or shrink wrapping.
2. The area provided for storage shall be clean, dry and exposure to dust minimized. Cover duct stored on construction site with 6 mil plastic.
3. Installation:
   a. Work area shall be clean, dry, and protected from the elements.
   b. Internal surface of uninsulated duct shall be wiped immediately prior to installation.
   c. Open ends on completed work and overnight work-in-progress shall be sealed.
4. Replace internal duct liner that gets wet.

3.2 DUCT INSTALLATION - GENERAL

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of duct system. Indicated duct locations, configurations, and arrangements were used to size ducts and calculate friction loss for air-handling equipment sizing and for other design considerations. Install duct systems as indicated unless deviations to layout are approved on Shop Drawings and Coordination Drawings.

B. Install ducts according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" unless otherwise indicated.

C. Install ducts with fewest possible joints.

D. Install factory or shop-fabricated fittings for changes in direction, size, and shape and for connections.

E. Unless otherwise indicated, install ducts vertically and horizontally, and parallel and perpendicular to building lines.

F. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.

G. Install ducts with a minimum clearance of 1-inch, plus allowance for insulation thickness.

H. Route to avoid passing through transformer vaults, electrical equipment rooms and enclosures, data closets, and elevator machine rooms.

I. Where ducts pass through non-fire-rated interior partitions and exterior walls and are exposed to view, cover the opening between the partition and duct or duct insulation with sheet metal flanges of same metal thickness as the duct. Overlap openings on four sides by at least 1-1/2 inches.

J. Where ducts pass through fire-rated interior partitions and exterior walls or smoke barriers, install fire dampers, smoke dampers or combination fire and smoke dampers as required. Comply with requirements in Section 233300 “Duct Accessories” for fire and smoke dampers.

3.3 EXPOSED DUCTWORK - ADDITIONAL INSTALLATION REQUIREMENTS

A. Protect ducts exposed in finished spaces from being dented, scratched, or damaged.

B. Trim duct sealants flush with metal. Create a smooth and uniform exposed bead. Do not use two-part tape sealing system.

C. Grind welds to provide smooth surface free of burrs, sharp edges, and weld splatter. When welding stainless steel with a No. 3 or 4 finish, grind the welds flush, polish the exposed welds, and treat the welds to remove discoloration caused by welding.

D. Maintain consistency, symmetry, and uniformity in the arrangement and fabrication of fittings, hangers and supports, duct accessories, and air outlets.

E. Repair or replace damaged sections and finished work that does not comply with these requirements.

3.4 HANGERS AND SUPPORTS INSTALLATION

A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 5, "Hangers and Supports.”

B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.
   1. Where practical, install concrete inserts before placing concrete.
   2. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
   3. Use powder-actuated concrete fasteners for standard-weight aggregate concretes or for slabs more than 100 mm4 inches thick.
   4. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes or for slabs less than 4 inches thick.
   5. Do not use powder-actuated concrete fasteners for seismic restraints.

C. Hanger Spacing: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1M Table 5-1, "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct," for maximum hanger spacing; install hangers and supports within 24 inches of each elbow and within 1200 mm48 inches of each branch intersection.

D. Hangers Exposed to View: Threaded rod and angle or channel supports or as shown on the Drawings.

E. Support vertical ducts with steel angles or channel secured to the sides of the duct with welds, bolts, sheet metal screws, or blind rivets; support at each floor and at a maximum interval of 16 feet.

F. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

G. Roof Mounted Duct Support System:
1. Verify that roofing system is complete and that roof surfaces are smooth and flat and are ready to receive work.
2. Verify that roof temperature is a minimum of 60 degrees F for proper adhesive performance.
3. Use care in installation of duct support systems not to damage roofing, flashing, equipment, or related materials.
4. Clean surfaces of roof to receive duct support bases. Remove gravel from gravel surfaced roofs, remove dirt, dust, oils, and other foreign materials from all roofs. Prime existing membrane with a primer that is compatible with existing components in the roofing system.
5. Bases and support framing shall be located as indicated on the drawings and as specified herein. The support of all ductwork shall be complete and adequate, whether or not all required devices are shown.
6. Set bases with adhesive in accordance with manufacturer's installation instructions. Accurately locate and align bases. Where applicable, replace gravel around bases. Install strut framing as required to properly support ductwork.

3.5 CONNECTIONS

A. Make connections to air handlers and fans with flexible connectors complying with Section 233300 "Air Duct Accessories."

B. Make connections to air terminal units as shown on the drawings.

C. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for branch, outlet and inlet, and terminal unit connections.

3.6 DUCT SEALING

A. Seal ducts for duct static-pressure, seal classes, and leakage classes specified in Part 3 "Duct Schedule" Article according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

B. Seal Classes:
1. Seal Class A: Seal all transverse joints, longitudinal seams, and duct wall penetrations.
2. Seal Class B: Seal all transverse joints and longitudinal seams.
3. Seal Class C: Seal all transverse joints.

C. All connections shall be sealed under all Seal Classes, including but not limited to spin-ins, taps, other branch connections, access doors, access panels, and duct connections to equipment. Sealing that would void product listings is not required. Spiral lock seams need not be sealed.

D. Seal ducts and perform leak tests (where scheduled in Part 3, Article "Field Quality Control below") prior to concealment of any portion of the duct systems and before external insulation is applied.

E. Spiral Duct Transverse Joints: Joints made with gasketed slip connections meeting leakage Class 4 do not require additional sealing when installed in accordance with the manufacturer's instructions.

3.7 DUCT SCHEDULES

A. Ductwork General: Unless otherwise noted, construct ductwork, fittings, and transitions according to the following schedule:

AIR SYSTEM	MATERIAL	PRESSURE CLASS	SEAL CLASS

Rectangular Supply Duct Before Air Terminal Units	Galvanized	Plus 4-inches wg	A
Round and Flat Oval Supply Duct Before Air Terminal Units	Galvanized Spiral Duct	Plus 4-inches wg	A
Supply Duct After Air Terminal Units	Galvanized	Plus 1-inch wg	C
Low Pressure Supply Ducts	Galvanized	Plus 1-inch wg	C
Return Ducts – Low Pressure	Galvanized	Minus 1-inch wg	C
General Exhaust Ducts	Galvanized	Minus 1-inches wg	C
Transfer Ducts	Galvanized	Minus 1-inch wg	C
Round Supply, Return and General Exhaust Duct – Low Pressure; Size > 14-inch Diameter	Galvanized Spiral Duct	Minus 2-inch to Plus 2-inches wg	C
Round Supply, Return and General Exhaust Duct – Low Pressure; Size ≤ 14-inch Diameter	Galvanized Snap Lock– Min 26 gauge	Minus 1-inch to Plus 1-inch wg	C
Low pressure Supply, OSA Supply, Return and General Exhaust Duct Risers Which Penetrate More Than One Floor	Galvanized	Minus 1-inch to Plus 1-inch wg	B
Notes: 1. Supply duct before the air terminal unit is duct installed between the air handler and the air terminal unit.			

B. Elbow Configuration:
   1. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-2, "Rectangular Elbows."
      a. Velocity 1000 fpm or Lower:
         1) Radius Type RE 1 with minimum 0.6 radius-to-diameter ratio.
      b. Velocity 1000 to 1500 fpm:
         1) Radius Type RE 1 with minimum 1.0 radius-to-diameter ratio.
      c. Velocity 1500 fpm or Higher:
         1) Radius Type RE 1 with minimum 1.5 radius-to-diameter ratio.
   2. Round Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-4, "Round Duct Elbows."
      a. Minimum Radius-to-Diameter Ratio and Elbow Segments: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 3-1, "Mitered

Elbows." Elbows with less than 90-degree change of direction have proportionately fewer segments.

1) Velocity 1000 fpm or Lower: 0.6 radius-to-diameter ratio and three segments for 90-degree elbow.
2) Velocity 1000 to 1500 fpm: 1.0 radius-to-diameter ratio and four segments for 90-degree elbow.
3) Velocity 1500 fpm or Higher: 1.5 radius-to-diameter ratio and five segments for 90-degree elbow.

b. Round Elbows, 12 Inches and Smaller in Diameter: Stamped or pleated.
c. Round Elbows, 14 Inches and Larger in Diameter: Welded.

C. Branch Configuration:
1. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-6, "Branch Connection."
a. Rectangular Main to Rectangular Branch: 45-degree entry.
b. Rectangular Main to Round Branch – Low pressure: Spin in.
c. Rectangular Main to Round Branch – Exceeding 3-inch pressure class: Conical tap.
d. Rectangular Main to Round Branch where main depth is less than 2-inches taller than branch diameter: 45-degree entry with square to round.
e. Provide damper in all low-pressure branch connections.
2. Round and Flat Oval: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-5, "90 Degree Tees and Laterals," and Figure 3-6, "Conical Tees." Saddle taps are permitted in existing duct.
a. Velocity 1000 fpm or Lower: 90-degree tap.
b. Velocity 1000 to 1500 fpm: Conical tap.
c. Velocity 1500 fpm or Higher: 45-degree lateral.

3.8 FIELD QUALITY CONTROL

A. Perform tests and inspections prior to the use or concealment of any portion of a duct system. Ducts shall be considered to be concealed where installed in shafts or covered by coatings or wraps that prevent the ductwork from being visually inspected on all sides.

B. Duct Leakage Tests:
1. Comply with ASHRAE/SMACNA Standard 126 “Method of Testing HVAC Air Ducts and Fittings.” Submit a test report for each test.
2. In paragraphs below specifying which ductwork is to be leak tested, where representative sections to be tested are specified to be only 25-percent of the total duct area installed of the system to be tested, then the following “25-50-100” methodology shall be followed:
a. Should the tested 25-percent fail to meet the requirements of this article, then 50-percent of the total installed duct area shall be tested.
b. Should the tested 50-percent fail to meet the requirements of this article, then 100-percent of the total installed duct area shall be tested.
3. All sections to be tested shall be selected by the building owner or the owner’s representative.
4. Test the following duct systems:
a. Ducts specified to have Class A seal: Test representative duct sections totaling no less than 100-percent of total installed duct area for the designated duct systems.
5. Remake leaking joints and retest until leakage is equal to or less than maximum allowable.
6. No leaks shall be audible.
7. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If static-pressure classes are not indicated on Drawings, test system at maximum system design pressure. Do not pressurize systems above maximum design operating pressure.

8. Positive pressure leakage testing is acceptable for negative pressure ductwork.
9. Maximum allowable leakage (L_{max}) shall be calculated as follows:

$$L_{max} = C_L(P)^{0.65}$$

Where:

L_{max} = maximum permitted leakage in cfm/100 ft^2 duct surface area.

C_L = duct leakage class, cfm/100 ft^2 at one in. wg.

6 for rectangular sheet metal, rectangular fibrous, and round flexible ducts.

3 for round/flat overall sheet metal or fibrous glass ducts.

P = test pressure, which shall be equal to the design duct pressure class rating in inches of wg.

	Leakage Class (C_L) = CFM Leakage per 100 ft^2 @ 1-inch wg		
SEAL CLASS	C	B	A
RECTANGULAR METAL	24	12	6
ROUND METAL	12	6	3

3.9 PAINTING

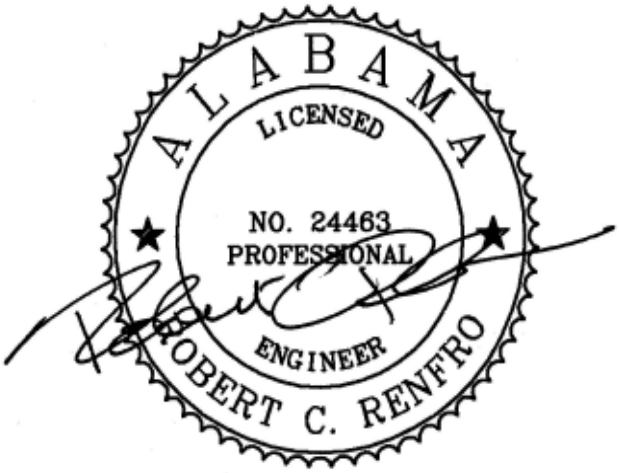
A. Paint interior of metal ducts that are visible through registers and grilles and that do not have duct liner. Apply one coat of flat, black, latex paint over a compatible galvanized-steel primer. Paint materials and application requirements are specified in Sections 099113 "Exterior Painting" and 099123 "Interior Painting."

3.10 START UP

A. Air Balance: Comply with requirements in Section 230593 "Testing, Adjusting, and Balancing for HVAC.

END OF SECTION 23 3113

This page intentionally left blank



SECTION 26 00 00

COVER - RCR

DIVISION 26/27/28

ELECTRICAL SPECIFICATIONS

PREPARED BY

4/27/2026

SECTION 26 05 00

BASIC ELECTRICAL MATERIALS AND METHODS

PART 1 - GENERAL

1.1 DESCRIPTION

A. General Conditions:
1. The accompanying General Conditions (front-end specifications) shall apply to and form a part of this section.

B. General Requirements:
1. Carefully examine General Conditions, other specification sections, and other drawings (in addition to Electrical) in order to be fully acquainted with their effect on electrical work.
2. Do all work in compliance with all applicable codes, laws, and ordinances, the National Electrical Safety Code, the National Electrical Code (hereinafter referred to as "Code"), applicable energy codes, and the regulations of the local utility companies. Obtain and pay for any and all required permits, inspections, certificates of inspections and approval, and the like.
3. Cooperate with other trades and contractors at job. Perform work in such manner and at such times as not to delay work of other trades. Complete all work as soon as the structure and installations of equipment will permit. Patch, in a satisfactory manner and by the proper craft, any work damaged by electrical workmen.
4. Electrical contracting firm shall be licensed as an electrical contractor in the state where work will be performed

1.2 GENERAL SCOPE OF ELECTRICAL WORK (REFER TO DRAWINGS FOR OTHER SPECIFIC SCOPE ITEMS)

A. Furnish all labor and materials to complete electrical work as shown on drawings and/or herein specified.

B. Remove all existing electrical equipment and wiring made obsolete by this project and remove or relocate all electrical services located on or crossing through the project property, either above or below grade, which would obstruct the construction of the project or conflict in any manner with the completed project or any code pertaining thereto. Dispose of salvageable materials as directed by the Architect. Contractor shall schedule meeting to review scope of electrical demolition and to confirm scope and phasing of proposed demolition with the owner in the presence of the prime consultant prior to start of any electrical demolition.

C. Furnish and install complete power, telephone and other electrical services as shown on drawings and/or specified herein.

D. Pay all electrical utility company service charges (if any) in connection therewith, including permanent meter deposit. Meter deposits will be refunded to Contractor at time of Owner's acceptance.

E. Furnish and install complete power distribution system as shown on drawings and/or specified herein.

F. Furnish and install disconnect switches for motors as shown on drawings and/or specified herein.

G. Furnish and install complete electrical grounding systems as shown on drawings and/or specified herein.

H. Install and connect electrical equipment mentioned in Division 26/27/28 Specifications or noted in drawings, whether furnished by electrical contractor or by others.
1. Where shown or specified, equipment furnished by others shall be installed and connected under this Contract.
2. Where shown or specified, Contractor shall receive, unpack, check and assume custody of equipment furnished by Others. Contractor shall assume responsibility for care and safekeeping of this equipment, when delivered into his custody. He shall protect it from moisture, dust and damage during construction and until Owner acceptance of project.

I. Furnish and install complete electrical lighting systems as shown on drawings and/or specified herein.

J. Furnish and install all electrical items shown on drawings and/or herein specified, unless shown or specified otherwise.

K. Furnish and install complete controls & auxiliary systems as shown on drawings and/or specified herein.

L. Furnish and install complete telephone/data raceway (including all outlet boxes, face plates, conduit raceways, telephone backboards, terminal cabinets, etc.), wiring and devices system as shown on drawings and/or specified herein.

M. Furnish and install a complete Fire Alarm System as shown on drawings and/or specified herein.

N. Furnish and install a complete Surge Protection System as shown on drawings and/or specified herein.

O. Furnish and install a complete Building Lightning Protection System as shown on drawings and/or specified herein.

P. Procure and pay for permits and certificates as required by local and state ordinances and fire underwriter's certificate of inspection.

Q. Balance loads as equally as practicable on services, distribution feeders, circuits and buses. Provide typewritten directory for each panel.

R. Unless specifically indicated or required otherwise, terminate all circuitry/cabling provided within this contract at associated equipment/devices/etc. in accordance with all applicable codes, standards and supplier requirements, whether associated equipment/device/etc. is furnished within this contract or by others.

S. Complete field testing, adjustment & startup of all systems listed above as shown on drawings and/or specified herein.

PART 2 - PRODUCTS

2.1 APPROVED MATERIALS AND DEVICES

A. Where not otherwise specified, provide only new, standard, first-grade materials/systems throughout, conforming to standards established by Underwriter's Laboratories, Inc., and so marked or labeled, together with manufacturer's brand or trademark. All equipment/systems subject to approval of Architect before installation. All like items and associated equipment/systems shall be of one manufacturer.

B. To ensure proper coordination, it is intended that all electrical equipment and materials specified in Division 26/27/28 of these specifications and shown on the electrical drawings be furnished and installed by the electrical sub-contractor. It will not be permissible for any of these items to be furnished directly by the general contractor without the electrical contractor's coordination.

C. To ensure commonality of spare parts, it is required that the electrical contractor provide the same brand for all circuit breakers, starters, power equipment, etc. provided under the following divisions of these specifications:
1. SECTION 26 24 16: POWER PANELBOARDS - CIRCUIT BREAKER TYPE
2. SECTION 26 24 17: LIGHTING PANELBOARDS
3. SECTION 26 28 16: SAFETY SWITCHES AND FUSES

2.2 SUBMITTALS

A. All submittals to the design team shall be accompanied by a letter summarizing all proposed deviations from specified products or pre-approved substitutions. The absence of such a letter shall be understood to indicate that the contractor intends to meet all contract requirements, regardless of cut-sheets/data-sheets provided within the submittal.

B. Submit to Architect ten (10) days prior to bid date three (3) copies of any items and/or manufacturers which are proposed as substitutes for those specified.

C. Submit to Architect promptly after award of Contract and prior to purchasing, the number of copies required by the contract. All drawings of a specific item or system shall be made in one submittal, and within thirty (30) days after award of Contract. Shop drawings of all power equipment shall contain exact details of device placement, phasing and numbering, in form of elevations, for each major piece of equipment. Shop drawings shall be submitted on the following:
1. SECTION 26 05 36: CABLE TRAYS
2. SECTION 26 09 43: LIGHTING CONTROL SYSTEM
3. SECTION 26 24 16: POWER PANELBOARDS - CIRCUIT BREAKER TYPE
4. SECTION 26 24 17: LIGHTING PANELBOARDS
5. SECTION 26 28 16: SAFETY SWITCHES AND FUSES
6. SECTION 26 41 00: LIGHTNING PROTECTION SYSTEM
7. SECTION 26 43 00: SURGE PROTECTIVE DEVICES
8. SECTION 26 50 00: LIGHTING MATERIALS AND METHODS
9. SECTION 27 10 00: STRUCTURED CABLING SYSTEM
10. SECTION 28 20 00: CCTV SURVEILLANCE SYSTEM - IP
11. SECTION 28 31 00: FIRE ALARM SYSTEM

12. SECTION 28 78 00: EMERGENCY RESPONDER RADIO COVERAGE SYSTEM
13. ALL POWER DISTRIBUTION EQUIPMENT (i.e. SWITCHBOARDS, PANELBOARDS, DRY TYPE TRANSFORMER, ETC.)
14. ALL ELECTRICAL AND TELECOMMUNICATION EQUIPMENT LAYOUTS - Submittals shall include ¼" = 1'-0" CAD drawings (hand drawn sketches will not be accepted) of each electrical room, IT room, electrical equipment stand, generator area, or any other similar area with electrical equipment. Drawings shall indicate all panelboards, transformers, switchboards, generators, equipment racks, control panels, HVAC equipment, etc. that are located in each electrical/IT area. Layouts shall show that each piece of electrical equipment has the clearances, working space and dedicated equipment space required by applicable codes. No conduits to equipment within these areas shall be installed until submittals have been provided and returned without exception by the design team.

D. The contractor shall fully review, comment upon and correct all shop drawings as required to assure compliance with contract documents prior to submittal to Architect. The failure of the contractor to properly review and correct shop drawings prior to submittal will result in rejection of shop drawings by the engineer. Review by the Architect will be for general conformance with contract documents. The contractor shall be fully responsible for correctness of all submitted dimensions, details, quantities and locations.

E. None of the above items shall be installed until shop drawings or catalog data have been reviewed by Architect without rejection or required resubmittal. Any listed item not submitted, even if specified, shall be considered not acceptable and shall be removed if directed.

F. Any required resubmittal will be reviewed by the Architect for conformance with previously issued comments only. The contractor shall be responsible for verifying that all items not specifically requiring resubmittal have not been altered from the previously reviewed submittal.

G. Material proposed for substitution shall be of the same quality, perform the same functions, conform to such physical dimensions and appearance as are required by the Architect. All material proposed for substitution is subject to the approval of the Architect and his authority for approval is final. No material proposed for substitution will be considered unless all submittal data complies with the drawings and specifications of Section 16 as to time of submission, number of copies of submittal, and detail requirements.

H. Samples of material shall be furnished where required by drawings or Division 26/27/28 Specification, or as requested by the Architect on items proposed as substitutes.

I. Submit to Architect a certificate of final inspection from local inspection department.

PART 3 - EXECUTION

3.1 SITE VISIT

A. The Contractor shall visit the site to determine existing dimensions and conditions affecting electrical work. Failure to do so in no way relieves Contractor of his responsibility under Contract.

3.2 CLEARANCE WITH UTILITIES

A. It shall be the responsibility of this Contractor, prior to bid, to reaffirm with the utility companies involved, that the locations, arrangement (and with power company voltage, phase, and metering required) and connections to utility service are in accordance with their regulations and requirements. If their requirements are at variance with these drawings and specifications, the Contract price shall include any additional cost necessary to meet those requirements without extra cost to Owner after a contract is entered into.

B. On many projects the utility company may levy charges due to locations, size or type service involved. The Contractor shall be responsible for these charges (including permanent meter deposit), unless such charges are not available prior to bid and Contractor so documents as described below. The meter deposit will be refunded to the contractor at time of Owner's acceptance.

C. Should above cost not be available, prior to bid, Contractor must submit a letter signed by a responsible utility company person so stating with his bid and in turn must be submitted by Prime Contractor with his bid to Owner. The cost will then be deleted from the Contract and become responsibility of the Owner.

D. Arrange with utility companies for such services as shown or herein specified and installation of meter where shown. Furnish with shop drawings a signed document from utility companies describing the location and type of services to be furnished and any requirements they may have. This document shall be signed for each utility company by a person responsible for granting such service.

3.3 WORKMANSHIP

A. All work shall be in accordance with the latest editions of NFPA 70 (National Electrical Code), NFPA 101 (Life Safety Code), National Electric Safety Code, International Building Code, applicable NECA standards and the rules and regulations of State and Local Authorities Having Jurisdiction.

B. All work shall be executed in a workmanlike manner and shall present a neat and mechanical appearance upon completion.

C. All equipment, devices, etc. shall be installed in accordance with manufacturer's recommendations.

D. All items shall be installed straight and plumb in a workmanlike manner and care shall be exercised so that like items are mounted the same position, heights and general location.

E. Keep site clean of accumulation of cartons, trash and debris.

3.4 SAFETY

A. The contractor is solely responsible for all job safety. Architect assumes no responsibility for job safety. Maximum consideration shall be given to job safety and only such methods as will reasonably insure the safety of all persons shall be employed. The codes and regulations of OSHA shall be given strict compliance as well as such other codes, laws, and regulations as may be applicable.

3.5 CONTRACT DOCUMENTS

A. Contract documents indicate diagrammatically, extent, general character and approximate location of work. Where work is indicated but minor details omitted, furnish and install it complete so as to perform its intended functions. For details and mechanical equipment, follow drawings provided by other disciplines (Architectural, Mechanical, Structural, Civil, etc.) and fit electrical work thereto.

B. Contract documents consist only of the hardcopy documents issued by the Prime Architect. Electronic documents issued directly by the electrical engineer to the contractor and/or its sub-contractors/vendors are issued for convenience only (electronic documents are not formal contract documents).

C. If the contractor and/or one of its suppliers require a one-time transfer of electronic files of the current electrical construction documents to prepare shop drawings (or for another similar purpose), it shall:
1. Sign a waiver prepared by the electrical engineer prior to the transmittal of these files.
2. Agree to pay the electrical engineer a fee of $50.00 per drawing, up to a maximum of $400 per transfer, payable upon receipt of the files.
3. To the fullest extent permitted by law, indemnify, hold harmless, and defend JRA from all claims, damages, losses and expenses, including attorneys' fees arising out of or resulting from the use of the CAD files.

D. Take finish dimensions at job in preference to scaled dimensions.

E. Except as above noted, make no changes in or deviations from work as shown or specified except on written order of Architect.

3.6 UNDERGROUND UTILITY/EQUIPMENT COORDINATION

A. Prior to commencement of work, verify exact locations of all existing or proposed underground utilities and/or underground equipment and verify that proposed electrical installation does not conflict with these items. Notify Architect immediately if any conflict is found.

3.7 EQUIPMENT STORAGE

A. Store all electrical equipment in dry, covered locations as directed by equipment manufacturers. Contractor shall be responsible for replacing or repairing improperly-stored equipment as directed by Architect.

3.8 EXCAVATION, CUTTING AND PATCHING

A. Perform all cutting and excavating as necessary for installation of electrical systems, unless specifically covered under another section. After Architect's observation, complete all excavation, filling and backfilling as directed under specifications for preparation of site and earthwork. Foundations for equipment shall be as specified under concrete section. Concrete pads shall be minimum of 6" thick; unless greater thickness required by equipment manufacturer. Obtain specific approval of Architect before cutting into any structural members.

B. For all such work employ competent workmen, and finish up in neat and workmanlike manner, equal to quality and appearance to adjacent work.

3.9 PENETRATIONS

A. All penetrations in water tight barriers shall be made so that barrier rating is not compromised. Furnish roof flashing for all equipment installed under Division 26/27/28 that penetrates through the roof. Appropriate flashing is specified under roofing and sheet metal section. Supply these flashings for installation under roofing and sheet metal section.

B. All fire/smoke barrier penetrations shall be made in accordance with a U.L. listed assembly to maintain the fire/smoke rating of the associated membrane.

C. Where penetrations are required through structural elements, verify penetration locations and sizes with structural engineer. In no case shall the structural integrity be compromised without written approval from structural engineer.

3.10 INSTALLATION OF EQUIPMENT - GENERAL

A. Care shall be exercised in exact routing and location of all items so as not to obstruct access to equipment, personnel walkways, or expose it to potential mechanical damage.

B. Items shall be securely anchored and/or fastened. Provide proper support for all equipment, devices, conduits, boxes, panels, etc. as required by code and for a workmanlike installation. Provide guy wiring for wood poles where required to prevent leaning. All construction shall meet the seismic design requirements of the building code. Items (especially transformers, light fixtures, equipment racks, freestanding gear, etc.) installed in seismic zones C, D, E or F shall be supported and braced per applicable codes and standards.

C. All wall, pole or frame-mounted electrical equipment shall be mounted to metal unistrut (or similar) frames of same material as electrical equipment. For example, pole-mounted painted or galvanized steel disconnect switches shall be mounted to galvanized steel unistrut frames.

D. All electrical equipment, furnished by Contractor or by others shall be covered and protected during construction.

E. All control cabinets, panels, motor control centers and other electrical cabinets and enclosures shall have all trash removed and be vacuumed clean. All foreign paint, etc., shall be removed from exterior and all scratches in finish touched up with same color and material as original. Any rusted areas shall be sanded, primed and repainted.

F. All relays, starters, push-button and other control devices shall be cleaned and if necessary, lubricated with CRC 2-26 to assure free operation.

3.11 MOTORS, STARTERS AND CONTROLS

A. Unless otherwise specified or shown, all motors will be furnished and installed under other sections of this specification.

B. Electrical Contractor shall install all starters and all electrical power wiring and connections to motors and starters.

C. Unless otherwise specified or shown, all control items for motors shall be furnished, installed and wired in conduit under other divisions of this specification.

3.12 CIRCUITS AND BRANCH CIRCUITS

A. Outlets shall be connected to branch circuits as indicated on drawings by circuit numbers. No more outlets than are indicated shall be connected to a circuit.

B. Branch circuit homeruns shall be installed as shown on drawings. Multiple homerun conduits shall not be combined by contractor into larger, single homerun conduits unless specific permission is granted by the Engineer.

3.13 LUG/TERMINAL RATINGS

A. All lug/terminal ratings, sizes, locations, types, etc. shall be coordinated with the associated conductor sizes, types, routings, etc. by the contractor.

B. All lugs/terminals/etc. shall be rated for 75 degree C terminations (minimum, unless specified otherwise).

3.14 EQUIPMENT FAULT CURRENT RATINGS

A. All equipment and breakers shall meet the minimum RMS symmetrical interrupting capacity ratings shown on plans for the associated distribution equipment. All interrupting ratings shall be full ratings. Where new devices or breakers are added to existing distribution equipment, the new devices/breakers shall have interrupting ratings matching or exceeding that of the existing distribution equipment.

3.15 OUTLET LOCATION

A. Symbols shown on drawings and mounting heights indicated on drawings and in specifications are approximate only. The exact locations and mounting height must be determined on the job and it shall be the Contractor's responsibility to coordinate with other trades to insure correct installation.

3.16 IDENTIFICATION

A. Each panel shall have each circuit identified. Panels without branch circuit nameplates shall have typewritten directories.

B. Each individually mounted switch, circuit breaker, starter and/or any other control or protective device shall identify equipment fed and fuse size, if any, by engraved plastic nameplate, white with black letters, screw attached.

C. See Specification Section 26 05 53 for additional requirements.

3.17 GROUNDING

A. All equipment shall be grounded and bonded in accordance with all state/local regulations, The National Electrical Code and as specified herein.

3.18 TELEPHONE WORK

A. Provide telephone raceways, outlets and backboards, as shown. Provide additional work as described in Specification Section 27 10 00 and/or shown on drawings. Bond all raceways together at backboards and provide No. 6 ground wire extending from raceway bonds to cold water pipe, in 1/2 inch raceway. Carefully ream ends of all raceways.

3.19 PAINTING

A. Refer to Painting/Finishing specifications for requirements regarding field painting of exposed conduit. Any scratches, dents or rust spots in conduit electrical enclosures, panels, motor control or any other electrical items shall have the dents removed, and they, along with any rust spots or scratches, sanded and touched up with the same exact color paint as original finish.

3.20 ACCEPTANCE TESTING

A. Upon completion of work, the entire electrical system installed within this project shall be tested and shall be shown to be in perfect working condition, in accordance with the intent of the specifications and drawings. It shall be the responsibility of the Electrical Contractor to have all systems ready for operation and to have an electrician available to operate same in accordance with and under the supervision of the observation representative(s) of the Architect. The Electrician shall be available to assist in removal of panel fronts, etc., to permit inspection as required.

B. The electrical sub-contractor shall include in bid price start-up assistance and training from a certified representative of the manufacturer for the following systems:
1. SECTION 26 09 43: LIGHTING CONTROL SYSTEM
2. SECTION 27 10 00: STRUCTURED CABLING SYSTEM
3. SECTION 28 20 00: CCTV SURVEILLANCE SYSTEM - IP
4. SECTION 28 31 00: FIRE ALARM SYSTEM
5. SECTION 28 78 00: EMERGENCY RESPONDER RADIO COVERAGE SYSTEM

3.21 OPERATION AND MAINTENANCE DATA

A. One set of marked “AS BUILT” drawings, three (3) sets of all equipment catalog and maintenance data and three (3) sets of all final shop drawings, on all equipment requiring same shall be turned over to owner. These items shall be bound in hard back book. Contractor shall explain and demonstrate all systems to Owner’s representative.

3.22 GUARANTY-WARRANTY

A. Furnish a written Guarantee-Warranty, countersigned and guaranteed by General Contractor, stating:
1. That all work executed under this section will be free from defects of workmanship and materials for a period of one (1) year from date of final acceptance of this work.
2. Above parties further agree that they will, at their own expense, repair and replace all such defective work, and all other work damaged thereby, which becomes defective during the term of the Guaranty-Warranty.

END OF SECTION 26 05 00

SECTION 26 05 19

POWER CONDUCTORS AND CABLES 51V-600V

PART 1 - GENERAL

1.1 DESCRIPTION

A. Power Wires and Cables

B. Low Voltage Wires and Cables

PART 2 - PRODUCTS

2.1 POWER WIRES AND CABLES - 600 VOLT

A. General: Conductors shall have current carrying capacities as per N.E.C. and with 600 volt insulation, #12 minimum except for controls and fixture wire. Conductors shall be copper.

B. General Application (see below for exceptions):
1. At or Below Grade (including within slab-on-grade):
   a. #8 or larger conductors:
      1) XHHW or RHH/RHW/USE stranded (in conduit).
   b. #10 or smaller conductors for circuits terminating at motors:
      1) THHN/THWN or XHHW stranded (in conduit).
   c. #10 or smaller conductors (excluding circuits terminating at motors):
      1) THHN/THWN or XHHW solid (in conduit).
2. Above Grade:
   a. #8 or larger conductors:
      1) THHN/THWN, XHHW or RHH/RHW/USE stranded (in conduit).
   b. #10 or smaller conductors for circuits terminating at motors:
      1) Where Exposed within Electrical Rooms OR Concealed in Wall/Ceiling Cavities (not concrete encased, etc.):
         a) THHN/THWN, XHHW or RHH/RHW/USE stranded (in conduit) or
         b) Metal-Clad (MC) cabling with THHN/THWN stranded conductors (conduit not required).
      2) Other Locations (where exposed outside electrical rooms or concrete encased): THHN/THWN, XHHW or RHH/RHW/USE stranded (in conduit).
   c. #10 or smaller conductors (excluding circuits terminating at motors):
      1) Where Exposed within Electrical Rooms OR Concealed in Wall/Ceiling Cavities (not concrete encased, etc.):
         a) THHN/THWN, XHHW or RHH/RHW/USE solid (in conduit) or
         b) Metal-Clad (MC) cabling with THHN/THWN solid conductors (conduit not required).
      2) Other Locations (where exposed outside electrical rooms or concrete encased): THHN/THWN, XHHW or RHH/RHW/USE solid (in conduit).
3. Metal-Clad (MC) cabling shall be rated for redundant grounding where installed in patient care areas per N.E.C. Article 517.
4. Power Wire and cable shall be as manufactured by Southwire, Rome, Encore Wire, American Insulated Wire, Okonite, Phelps-Dodge, Amercable, Aetna or approved equal.

C. Emergency Feeder Wiring
1. Where specifically required by NEC articles 700, 701, or other similar sections, feeder-circuit wiring for emergency systems and legally-required standby systems shall be a listed electrical circuit protective system consisting of 2-hour fire-rated, mineral insulated, copper-sheathed wiring cable (Pyrotenax System 1850 or equal).

D. Class 1 Control Cabling (120VAC Control Circuits, Etc.)
1. Unless specified otherwise, Class 1 control cabling shall:
   a. Be rated for exposed cable tray installation.
   b. Be plenum rated.
   c. Be UL-rated for the proposed application.
   d. Be multi-conductor with overall outer sheath as required by the application. The insulation of each conductor within the overall multi-conductor cable shall be uniquely color-coded. Ground conductors (when provided) within the multi-conductor cable shall have green insulation. Conductors with green insulation shall not be used for conductors other than ground.
   e. Utilize copper conductors.
   f. Have wire gauge as required to limit voltage drop to acceptable limits determined by the system supplier and to meet all applicable code requirements.
   g. Where installed underground, within slab-on-grade or in exterior locations, be rated for wet locations.
   h. Where required for specific systems, meet the specific requirements (conductor quantity, wire gauge, insulation type, shielding, etc.) of the system supplier.
   i. Be rated for 600V.
   j. Be industrial grade.
   k. Have stranded conductors.
   l. Have sunlight/oil-resistant PVC/Nylon insulation and jacket with ripcord.
2. Control cabling shall be as manufactured by Belden, AlphaWire or General Cable.

E. Fixture Wiring
1. Conductor Types:
   a. Type TFFN or XFF.
2. Minimum Sizes:
   a. For fixtures up to 300 watts: #16.
   b. For fixtures over 300 watts up to 1500 watts: #14.
   c. For fixtures over 1500 watts: as required.
   d. Conductors to concrete pour fixtures: #12.
3. Fixture wire shall extend only from fixture to first junction, and not over 6 feet, except for concrete pour units.

2.2 WIRE CONNECTIONS:

A. All connector types:
1. Shall be properly rated for the proposed application by UL and per the manufacturer.

B. At Motor Connections (within motor terminal boxes):
1. On Unshielded Wire:
   a. Single conductor per phase: shall be made with insulated set screw connectors or 3M 5300 Series 1kV Motor Lead Connections kits with mechanical lugs as required.

b. Multiple conductors per phase: shall be made with insulated mechanical lugs, rated for the associated motor cable types, by Polaris or Ilsco.

2. On Shielded Power Wire:
   a. The braided shields and internal grounding conductors of shielded power (not instrumentation) cables shall be grounded at BOTH ends (at VFD/starter and at motor) with a termination kit provided by the cable supplier. This termination kit shall include a connection ring that makes contact around the full circumference of the braided shield, and connects all internal grounds to a common external ground point.

C. Other Dry locations:
1. On Wire larger than #10: shall be made with solderless, non-insulated compression-type connectors meeting requirements of Federal Specification WS-610e for Type II, Class 2 and shall be covered with Scotch #33 electrical tape so that insulation is equal to 150% of conductor insulation.
2. On Wire #10 and smaller: shall be made with one of the following:
   a. Ideal Wing Nuts or equal by 3M .
   b. Ideal Push-In Wire Connectors (for #12 and smaller only).

D. Other Wet/Damp locations:
1. On Wire larger than #10: shall be made with underground/direct-burial, waterproof rated EPDM or TPE-insulated connectors by Ilsco, Burndy or T&B.
2. On Wire #10 and smaller: shall be made with one of the following:
   a. Ideal Weatherproof or Underground Wire Connectors pre-filled with 100% silicone sealant as required by the application.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION

A. All wires and cables shall be installed in conduit unless specifically noted otherwise.

B. Metal-clad (MC) cabling (not required to be installed within conduit) may be used for above-grade, concealed branch circuits where allowed by code. MC cable installation shall:
1. NOT be installed exposed except in electrical rooms.
2. be provided with dedicated neutrals for all multi-wire circuits. Conductors shall be color coded as described below.
3. be run orthogonal with the building structure.
4. be supported per N.E.C. requirements. At a minimum MC cabling shall be supported on six foot intervals and within 12” of all outlet/junction boxes.
5. be supported independently from the building structure and shall not come into contact with other building systems (ductwork, piping, conduits, etc.).
6. be rated for redundant grounding where installed in patient care areas per N.E.C. Article 517.

C. All joints and splices on wire shall be made with solderless connectors, and covered so that insulation is equal to conductor insulation.

D. No splices shall be pulled into conduit.

E. No conductor shall be pulled until conduit is cleaned of all foreign matter.

F. Wire and cable shall be neatly formed, bundled and tied in all panelboards, wireways, disconnect switches, pullboxes, junction boxes, cabinets and other similar electrical enclosures.

G. All wires and cables installed in underground or other wet locations shall be rated by the manufacturer for wet locations.

H. Network cabling shall be continuous from endpoint to endpoint and shall not be spliced unless specifically noted otherwise.

I. All conductors/cabling (including spare conductors) shall be properly terminated unless specifically directed otherwise. See above for general termination hardware requirements.

3.2 POWER WIRE AND CABLE INSTALLATION:

A. No power conductor shall be smaller than #12 except where so designated on the drawings or hereinafter specified.

B. Multi-wire lighting branches shall be used as indicated.

C. Where more than three current-carrying conductors are installed in a single raceway or cable, conductors shall be derated as indicated in NEC Table 310.15(B)(3)(a).

D. Raceways/cables shall generally not be installed exposed to sunlight on roofs unless specifically required. Where raceways or cables are installed exposed to sunlight on roofs, conductors shall be derated with ampacities adjusted per NEC Table 310.15(B)(3)(c).

E. In installing parallel power conductors, it is mandatory that all conductors making up the feeder be exactly the same length, the same size, the same type of conductor with the same insulation. Each group of conductors making up a phase or neutral must be bonded at both ends in an approved manner.

F. In installing overhead main power services, a minimum of 5’-0” of cable per run shall be extended beyond the weatherhead(s) for connection to service drop. Confirm exact requirements with local utility company.

3.3 WIRE CONNECTIONS

A. See Part 2 above for material types.

B. Aluminum Wire Connections:
1. Where aluminum wiring is allowed, connections shall utilize compression fittings, no exceptions (Anderson Versa Crimp or equal).

C. Any stranded wire connection to wiring devices shall be made with crimp type terminals.

D. All electrical connections and terminals shall be tightened according to manufacturer’s published torque-tightening values with calibrated torque wrenches as required to clearly indicate final torque value to the contractor. Where manufacturer’s torque values are not provided, those specified in UL 486A & 486B shall be used.

E. All connections and connector types shall be installed in strict compliance with all requirements

of the connector manufacturer.

F. Under no condition shall the specified conductors be connected to terminals rated less than 75°C. Where conductors sized #1 or smaller are shown to be terminated at equipment and the terminals of that equipment are rated for less than 75°C, contractor shall install junction box near equipment to capture the specified conductors, splice with compression connections (rated for a least 75°C) and extend conductors with ampacity rating as required by NEC (based on terminal temperature rating) to equipment terminals. The length of the conductors to be terminated shall be as directed by the AHJ but not less than 48 inches.

3.4 LOW VOLTAGE (LESS THAN 50V) CONTROL AND NETWORK CABLE INSTALLATION:

A. All wires and cables shall be installed in conduit unless specifically noted otherwise. Low voltage control and/or network cabling located within concealed, accessible ceiling spaces (such as above lay-in ceilings) may be run without conduit if the following requirements are met:
1. Cabling shall be plenum-rated, multi-conductor.
2. Cabling shall be supported by cable tray or with J-hook supports on intervals not to exceed 5'-0" on center. Cabling shall be supported solely from the cable tray or j-hooks supported from the building structure, without using piping, ductwork, conduit or other items as supports.
3. Cabling shall be properly bundled with plenum-rated Velcro straps on intervals not to exceed 30" on center.
4. Properly-sized conduit(s) shall be provided wherever cabling enters an inaccessible or exposed area (such as above gyp board ceilings or through walls). End bushings shall be provided on both ends of all raceway terminations. All fire/smoke barrier penetrations shall be made in accordance with a U.L. listed assembly.

3.5 CIRCUITS AND BRANCH CIRCUITS

A. Outlets shall be connected to branch circuits as indicated on drawings by circuit number adjacent to outlet symbols, and no more outlets than are indicated shall be connected to a circuit.

3.6 LABELING AND COLOR CODING OF WIRE AND CABLE

A. Refer to Specification Section 26 05 53 for all labeling requirements.

B. A color coding system as listed below shall be followed throughout the network of branch power circuits as follows:

PHASE	120/208/240/ COLOR	120/240 HIGH LEG DELTA COLOR	277/480 VOLT COLOR
A	BLACK	BLACK	BROWN
B	RED	ORANGE (FOR HI-LEG)	ORANGE
C	BLUE	BLUE	YELLOW
NEUTRAL	WHITE	WHITE	GRAY
GROUND	GREEN	GREEN	GREEN

C. Where dedicated neutrals are installed for multi-wire branch circuits, the neutral conductors shall be color coded as follows:

PHASE	120/208/240/ COLOR	120/240 HIGH LEG DELTA COLOR	277/480 VOLT COLOR
NEUTRAL A	WHITE W/ BLACK TRACER	WHITE W/ BLACK TRACER	GRAY W/ BROWN TRACER
NEUTRAL B	WHITE W/ RED TRACER	WHITE W/ ORANGE TRACER (FOR HI-LEG NEUTRAL)	GRAY W/ ORANGE TRACER
NEUTRAL C	WHITE W/ BLUE TRACER	WHITE W/ BLUE TRACER	GRAY W/ YELLOW TRACER

D. Control Conductors: Shall be color coded by use of colored "tracers". No control circuit shall contain two identical conductors. For example, a set of five (5) control conductors for a pushbutton station represents one (1) control circuit which would require five (5) uniquely-colored control conductors.

3.7 TESTING

A. The insulation resistance of all feeder conductors (feeding electrical distribution equipment such as switchboards, panelboards, transfer switches, transformers, etc.) shall be tested at the load side of the feeder breaker with a 1000-volt DC Megger Tester prior to energization or final termination. Any feeder conductor with an insulation resistance less than the recommended minimums in the latest version of NETA Acceptance Testing Specification ("ATS") standard shall be replaced by the contractor at the contractor's expense. All final test results shall be clearly documented (with date, time, feeder, results, test equipment, etc.), and the final test results shall be submitted to the design team for review.

END OF SECTION 26 05 19

SECTION 26 05 26

GROUNDING

PART 1 - GENERAL

1.1 GENERAL

A. THE WORK UNDER THIS SECTION INCLUDES BUT IS NOT LIMITED TO GROUNDING OF THE FOLLOWING:
1. Service Equipment.
2. Transformers.
3. Non-current carrying conductive surfaces of equipment.
4. Metal Buildings.
5. Structures.
6. Other Equipment.

1.2 GENERAL REQUIREMENTS

A. All equipment, building steel, and main service shall be effectively and permanently grounded with a conductor cross section as required by the National Electrical Code and of capacity sufficient to insure continued effectiveness of the ground connections for fault current. Ground conductors shall be as short and straight as possible, protected from mechanical injury and, if practicable, without splice or joint.

B. All grounding connections shall be installed in accordance with the National Electrical Code and all local codes and requirements. Such codes shall be considered minimum requirements and the installation of the grounding system shall insure freedom from dangerous shock voltage exposure and provide a low impedance ground fault path to permit proper operation of overcurrent and ground fault protective devices.

PART 2 - PRODUCTS

2.1 CONDUCTORS

A. All grounding conductors shall be insulated with green colored, 600 volt insulation unless noted otherwise.

B. Motors having power supplied by single conductor wire in conduit shall be grounded through the conduit system. Flexible conduit shall be “jumpered” by an appropriate bonding conductor.

2.2 GROUNDING ELECTRODES

A. Grounding electrodes shall be copper-clad steel rods 3/4 inch in diameter and ten feet long. Where longer electrodes are necessary to reduce the ground resistance, Contractor shall provide sectional rods, connectors, drive heads, etc.

2.3 CONNECTIONS

A. All conductor-to-conductor, conductor-to-ground rod, conductor-to-structure, conductor-to-fence connections of #6 and larger sized conductors and underground ground connections shall

be permanent exothermic welded connections (Cadweld or equal) unless otherwise noted on applicable drawings.

B. Connections to equipment shall be by bolted compression type lugs (except for motors). When the conductor is #6 and larger, the lug shall be joined to the conductor by an exothermic weld (Cadweld or equal).

C. Motors to be grounded by the grounding conductors run with the power conductors shall have a split-post grounding stud installed in the connection box.

D. Each cast pull box or junction box shall have a ground lug, connected to largest ground conductor to enter box.

E. Ground connections at conduit terminations shall be made by approved grounding bushings (see Raceways Specification Section for additional requirements).

2.4 MANUFACTURERS

A. Conduit clamps and connectors shall be manufactured by Raco, OZ., or Ercon.

B. Lugs shall be as manufactured by Square “D”, Burndy, or T and B.

C. Exothermic weld connections shall be as manufactured by Cadweld, or approved equal.

D. Ground rods shall be as manufactured by Joslyn or McGraw Edison.

E. Split post grounding shall be as manufactured by Burndy or T and B.

PART 3 - EXECUTION

3.1 MAIN SERVICE GROUND

A. The main service grounding electrode system shall consist of the following items bonded together by the grounding electrode conductor:
1. The main underground cold water pipe (metal).
2. The metal frame of the building.
3. Driven ground rods. Ground rods shall be embedded at the lowest point in the building and below the permanent moisture level. Ground rods shall be spaced a minimum of ten (10) feet apart and connected in parallel until resistance to ground does not exceed five (5) ohms.

B. The grounding electrode system shall be connected to the grounded conductor (neutral) on the supply side of the service disconnecting means by a grounding electrode conductor not smaller than that shown in Table 250.66 of the N.E.C. The main service equipment grounding conductor shall be connected to the grounding conductor on the supply side of the service disconnecting means in accordance with Table 250.122 of the N.E.C. for the ampere rating of the service entrance equipment. Where in a service entrance switchboard, the equipment grounding conductor shall not be less than 25% of the main bus rating. These connections shall be made inside the service entrance equipment enclosure.

3.2 TRANSFORMER GROUNDS

A. Dry type insulation transformers with a grounded conductor in the secondary shall be grounded in accordance with N.E.C. Section 250-30.

3.3 EXPOSED NON-CURRENT-CARRYING METAL PARTS

A. General: Ground connections to equipment or devices shall be made as close to the current carrying parts as possible, that is, to the main frame rather than supporting structures, bases or shields. Grounding connections shall be made only to dry surfaces that are clean and dry. Steel surfaces shall be ground or filed to remove all scales, rust, grease, and dirt. Copper and galvanized steel shall be cleaned to remove oxide before making welds or connections. Code size ground conductors shall be run in all power conduits and properly terminated at each end.

B. Ground conductors shall be routed as straight as possible. Where possible, ground conductors shall be routed such as to avoid bends exceeding 90 degrees or with a radius of less than 8".

C. Motors: Exposed non-current-carrying metal parts, shall be grounded by a grounding conductor either run with power conductors, and/or separate grounding conductors. Drawings will show method(s) to be used. The ground conductors with all motor conductors shall be connected to the ground buss in the motor connection box. Jumper connections shall be installed between frames and rigid conduit for equipment having flexible conduit connections (sealtight). All AC motor grounds shall provide a low impedance path to ground.

D. Raceways & boxes: All raceways, conduits, armored or shielded cable and all exposed non-current carrying metal parts shall be grounded. Such items shall be bonded together and permanently grounded to the equipment ground buss. Metallic conduits shall be connected by grounding or clamps to ground buss. Flexible "jumpers" shall be provided around all raceway expansion joints. Bonding straps for steel conduit shall be copper. Jumper connections shall be provided to effectively ground all sections or rigid conduit connected into plastic pipe. No metallic conduit shall be left ungrounded. In conduit systems interrupted by junction or switch boxes where locknuts and bushings are used to secure the conduit in the box, the sections of conduit and box must be bonded together. If conduit, couplings or fittings have a protective coating or non-conductive material, such as enamel, such coating must be thoroughly removed from threads of both couplings and conduit and the surface of conduit or fitting where the ground clamp is secured.

E. Enclosures: Metal conduits entering free standing motor control centers, switchboards or other free standing equipment shall be grounded by bare conductors and approved clamp. Any conduits entering low voltage (480 volts or below) equipment through sheet metal enclosure and effectively grounded to enclosure by double locknut or hub need not be otherwise bonded.

F. Equipment: In addition to equipment grounding provisions mandated by code requirements, additional equipment grounding provisions (including local ground rods, connections, etc.) shall be provided by the contractor as directed by equipment suppliers.

G. Both ends of ground busses in motor control centers, switchboards, etc., shall be separately connected to the main ground buss to form two separate paths to ground.

H. Fences and Grills: Fences and metal grills around equipment carrying voltage above 500 volts between phases shall be bonded together and to ground. Fences and grill work shall be grounded at every post, column, or support, and on each side of every gate.

3.4 ACCEPTANCE DOCUMENTATION AND TESTING

A. Contractor shall take and store photographs of all underground grounding system connections prior to burial of connections, for review by Engineer.

B. Upon completion of work, the entire ground system shall be shown to be in perfect working condition, in accordance with the intent of the Specifications.

C. Contractor shall measure the resistance between the main ground bonding jumper to true earth ground using the Fall of Potential method as described by ANSI/IEEE Standard 81 ("Guide for Measuring Earth Resistivity, Ground Impedance, and Earth Surface Potentials of an Earth System"). If the measured value is greater than five ohms, additional grounding electrodes shall be installed as described in Part 3.1 above. The final ground resistance value shall be submitted in writing, and documented via picture of the meter reading from the Fall of Potential test, to the Architect prior to the final observation, and shall be included in final O&M documentation.

END OF SECTION 26 05 26

SECTION 26 05 33

RACEWAYS

PART 1 - GENERAL

1.1 DESCRIPTION

A. THE WORK UNDER THIS SECTION INCLUDES BUT IS NOT LIMITED TO THE FOLLOWING:
1. Conduits
2. Conduit Fittings
3. Couplings & Connectors
4. Bushings
5. Raceway Hardware, Conduit Clamps & Supports
6. Watertight Entrance Seal Devices

PART 2 - PRODUCTS

2.1 CONDUITS

A. Rigid Galvanized Steel and I.M.C.:
1. Shall be galvanized outside and inside by hot dipping.
2. Shall be as manufactured by Republic, Wheatland, Triangle, Pittsburg Standard, Youngstown, Allied or equal.

B. E.M.T.:
1. Shall be Electro-Galvanized.
2. Shall be as manufactured by Republic, Wheatland, Triangle, Pittsburg Standard, Youngstown, Allied or equal.

C. Rigid Aluminum:
1. Shall be manufactured of 6063 Alloy, T-1 temper.
2. Shall be as manufactured by Republic, Wheatland, Triangle, Pittsburg Standard, Youngstown, Allied or equal.

D. Schedule 40 and 80 PVC:
1. Shall be composed of polyvinyl chloride and shall be U.L. rated type 40 or 80 for use with 90 degree rated conductors. Conduit shall conform to NEMA Standards and applicable sections of N.E.C.
2. The conduit manufacturer shall have had a minimum of 5 years experience in the manufacture of the products. Non-metallic raceways shall be as manufactured by Carlon, Triangle, Can-Tex, Allied or equal.

E. HDPE Innerduct
1. Shall be composed high density polyethylene and shall be orange in color, unless noted otherwise.
2. Shall be corrugated unless noted otherwise.
3. Shall be manufactured by Carlon, Ipex or equal.

F. Flexible Metallic Conduit:
1. Shall be continuous spiral wound and interlocked galvanized material, code approved for grounding.

G. Liquidtight Flexible Metallic Conduit:
1. Shall be galvanized steel-core sealtite, code approved for grounding.
2. Shall have an outer liquidtight, nonmetallic, sunlight-resistant jacket over an inner flexible metal core.
3. Shall be as manufactured by Electric-Flex, Anaconda or equal.

2.2 FITTINGS, COUPLINGS & CONNECTORS

A. Rigid Galvanized Steel and I.M.C. couplings and connectors shall be standard threaded type, galvanized outside and inside by hot dipping. Threadless and clamp type are not acceptable. Couplings/connectors shall be as manufactured by Raco, Efcor, or Appleton or equal.

B. All rain tight connectors shall be threaded Myers or approved equal, rated for outdoor application.

C. E.M.T. couplings and connectors shall be set screw, or steel compression type. All couplings and connectors shall be 720B, 730, 750B, or 760 series of Efcor or equal series of Raco. Pressure indented type connectors or cast metal will not be approved for any location. E.M.T. couplings and connectors shall be as manufactured by O-Z/Gedney, T&B, Efcor, Raco, Midwest or equal. E.M.T. fittings, couplings and connectors located within concrete (where allowed) shall be compression type and shall be adequately sealed with tape to ensure a concrete-tight seal.

D. Rigid Aluminum couplings and connectors shall be standard threaded type, of the same alloy as the associated conduit. Threadless and clamp type are not acceptable. Fittings shall be as manufactured by Thomas & Betts, Crouse-Hinds, Appleton, Pyle-National or equal.

E. All PVC couplings, adapters, end bells, reducers, etc., shall be of same material as conduit.

F. Liquidtight Flexible Metallic Conduit connectors shall be liquidtight with insulating throat or end bushing, designed for application with Liquidtight Flexible Metallic Conduit. Fittings shall be as manufactured by Efcor, Raco, Midwest or equal.

G. All LB unilets sizes 1 ¼” or larger shall have rollers.

H. Miscellaneous conduit fittings shall be as manufactured by Appleton, Crouse-Hinds, Pyle-National, Russell & Stoll or equal.

2.3 BUSHINGS

A. All non-grounding rigid bushings 1-1/4” and larger shall be the insulating type (O-Z/Gedney type “BB” or equal by T&B, Midwest Electric or Penn Union).

B. All non-grounding rigid bushings 1” and smaller shall be threaded malleable iron with integral noncombustible insulator rated for 150°C. Non-grounding rigid conduit bushings shall be O-Z/Gedney type “B” or equal by T&B, Midwest Electric or Penn Union.

C. All grounding rigid bushings shall be threaded malleable iron with integral noncombustible insulator rated for 150°C. All grounding rigid conduit bushings shall be O-Z/Gedney type "BLG" or equal by T&B, Midwest Electric or Penn Union.

2.4 HARDWARE, CONDUIT CLAMPS AND SUPPORTS

A. All hardware such as expansion shields, machine screws, toggle bolts, "U" or "J" bolts, machine bolts, conduit clamps and supports shall be of corrosion resistant materials (stainless steel, aluminum, galvanized or plated steel, or other approved materials).

B. Hardware in contact with aluminum handrails, plates or structural members and all hardware in exterior, wet or corrosive areas shall be type 316 stainless steel or aluminum (with bitumastic paint coating to isolate aluminum from contact with concrete where necessary) unless specifically noted otherwise.

C. Supports in exterior, wet or corrosive locations shall be type 316 stainless steel or aluminum (with bitumastic paint coating to isolate aluminum from contact with concrete where necessary) unless specifically noted otherwise.

D. Supports in extremely corrosive environments (such as chlorine or fluoride storage rooms) shall be PVC-Coated steel unless specifically noted otherwise.

E. Hardware and conduit clamps shall be as manufactured by Efcor, Steel City, G.A., Tinnerman or equal.

2.5 WATERTIGHT ENTRANCE SEAL DEVICES

A. For new construction, seal devices shall consist of oversized sleeve and malleable iron body with sealing rings, pressure rings, sealing grommets and pressure clamps as required (O-Z/Gedney type FSK/WSK or equal).

B. For cored-hole applications, seal devices shall consist of assembled dual pressure disks with neoprene sealing rings and membrane clamps as required (O-Z/Gedney type CSM or equal).

PART 3 - EXECUTION

3.1 RACEWAY APPLICATION

A. Minimum Diameter: 1/2-inch.

B. Raceway Type: Raceway types shall be as specified below, unless indicated otherwise on drawings:
   1. Exterior, Exposed: Rigid Galvanized Steel or I.M.C. unless otherwise noted.
   2. Other Exterior (Concrete-Encased or Direct Earth Buried): Schedule 40 PVC. PVC conduit shall convert to metallic conduit prior to exiting concrete-encasement or direct earth burial. See "transition" items below for additional requirements. Conduits shall be left exposed until after Architect's observation.
   3. Interior, Exposed:
      a. Hazardous Locations: Rigid Galvanized Steel .
      b. Wet Locations (including, but not limited to, Pump Rooms, Wet Wells, Underground Vaults, and other similar locations): Rigid Galvanized Steel or I.M.C. .

c. Dry Locations Where Subject to Mechanical Damage (including, but not limited to, below 10'-0" A.F.F. in shop, storage, warehouse and other similar areas): Rigid Galvanized Steel or I.M.C..
d. Extremely Corrosive Locations (Chlorine Storage Rooms, Fluoride Storage Rooms and other similar areas): Schedule 80 PVC.
e. Other Dry Locations: E.M.T.

4. Interior, Concealed:
   a. Embedded inside Poured Concrete Walls, Ceilings or Floors, with a minimum of 2" of concrete between finished surface and outer wall of conduit on all sides, where no anchor bolts, screws or other similar items will be installed: Schedule 40 PVC. PVC conduit shall convert to metallic conduit (exact type as specified elsewhere within this section) prior to exiting poured concrete-encasement of wall, ceiling, floor or ductbank. See "transition" items below for additional requirements.
   b. Other Raceways Embedded inside Poured Concrete Walls, Ceilings or Floors (not meeting requirements above): Rigid Galvanized Steel or I.M.C. (coated with two (2) spiral-wrapped layers of 3M Scotchrap 50 PVC tape or two coats of asphaltum paint where below grade or within concrete).
   c. Other Raceways: E.M.T.
5. Terminations at motors, transformers and other equipment which has moving or vibrating parts:
   a. Exterior or Wet Locations (including, but not limited to, Pump Rooms, Wet Wells, Underground Vaults, and other similar locations): Liquidtight Flexible Metallic Conduit (shall generally not exceed 24 inches in length) with watertight fittings.
   b. Dry, Interior Locations: Flexible Metallic Conduit (shall generally not exceed 24 inches in length).
6. Terminations at fixtures mounted in grid-type ceilings:
   a. Flexible Metallic Conduit or MC cabling (shall generally not exceed 72 inches in length and shall run from junction box to fixture, not from fixture to fixture).
7. Transition from underground or concrete-encased to exposed:
   a. Convert PVC to Rigid Galvanized Steel (coated with two (2) spiral-wrapped layers of 3M Scotchrap 50 PVC tape or two coats of asphaltum paint where below grade or within concrete) utilizing Rigid Galvanized Steel 90 degree bends (and vertical conduits as required by application) prior to exiting concrete/grade (except at outdoor pull boxes and under freestanding electrical equipment, where terminations shall be by PVC end bells installed flush with top of slab). Exposed portions of these coated conduits shall extend a minimum of 6" above floor level, and shall be installed at uniform heights.

3.2 RACEWAY INSTALLATION

A. General:
1. Follow methods which are appropriate and approved for the location and conditions involved. Where not otherwise shown, specified, or approved in a particular case, run all wiring concealed.
2. Where conduit crosses a structural expansion joint an approved conduit expansion fitting shall be installed.
3. A non-conductive polypropylene pull string, properly tied/secured at either end, shall be installed in all empty conduits.
4. Metal conduit field-cuts shall be cut square with a hacksaw and the ends reamed after threading.
5. PVC conduit field-cuts shall be made with hacksaw, and ends shall be deburred.

6. All PVC joints shall be made as follows:
   a. Clean the outside of the conduit to depth of the socket, and the inside of socket with an approved cleaner.
   b. Apply solvent cement as recommended by the conduit manufacturer to the interior of the socket and exterior of conduit, making sure to coat all surfaces to be joined.
   c. Insert conduit into the socket and rotate 1/4 to 1/2 turn and allow to dry.
7. All metallic conduit installed below grade or within concrete shall be coated with two (2) spiral-wrapped layers of 3M Scotchrap 50 PVC tape or two coats of asphaltum paint prior to installation.
8. Install ground wire sized per N.E.C. Table 250.122 in all conduits.
9. Use of running threads is absolutely prohibited. Conduit shall be jointed with approved threaded conduit couplings. Threadless and clamp type not acceptable.
10. Conduits shall be sized in accordance with latest National Electrical Code except when size shown on drawings. 1/2-inch conduit shall not contain conductors larger than No. 12 or more than four (4) No. 12 conductors.
11. Exposed, field-cut threads on all metal conduits shall be painted with zinc primer (for Galvanized Rigid or I.M.C.) .

B. Routing/Locating:
1. Exposed conduit runs shall be run level and plumb and shall, on interior of buildings, be run parallel and/or at right angles to building walls and/or partitions.
2. Conduit with an external diameter larger than 1/3 the thickness of a concrete slab shall not be placed in the slab. Conduits in slab shall not be spaced closer than 3 diameters on center.
3. Conduit run in ceiling spaces shall be run as high as possible, all at same level, and shall be supported from building structure. Do not support conduit from any other installation.
4. Conduit run within exterior CMU, concrete or other similar walls shall be run within the CMU cells / concrete structure / etc. Conduits shall not be run on the outside surface of CMU cells / concrete structure / etc. underneath exterior veneers / etc., which could cause a thermal break in the wall insulation or a future water intrusion problem.
5. Install conduit runs to avoid proximity to steam or hot water pipes. In no place shall a conduit be run within 6” of such pipes except where crossing is unavoidable, then conduit shall be kept at least 3” from the covering of the pipe crossed.
6. Before installing raceways for motors, HVAC equipment and other fixed equipment, check location of all equipment connections/terminal boxes with equipment supplier and locate and arrange raceways appropriately.
7. A minimum of 12” of clearance (or more as required by associated utility companies) shall be provided between the finished lines of exterior, underground conduit runs and exterior, underground utilities (gas, water, sewer, etc.).
8. Where any portion of raceway is installed in a wet environment (such as below grade) and located at a higher elevation than the raceway termination point in a dry environment, install watertight compound inside raceway at termination around cabling to prevent transfer of water through conduit system. Watertight compound shall be rated for the potential water head pressure, based on the assumption that ground water level would be at grade level.

C. Bends:
1. Do not make bends (in any raceway, including flexible conduits) that exceed allowable conductor bending radius of cable to be installed or that significantly restrict conductor flexibility.

2. All bends within concrete-encased ductbanks installed in exterior locations shall be long radius bends (24" minimum bending radius – varies with conduit diameter).
3. Where numerous exposed bends or grouped together, all bends shall be parallel, with same center and shall be similar in appearance
4. All PVC elbows, bends, etc., shall be either factory bends or made with an approved heat bender.

D. Support:
1. Anchor conduit securely in place by means of approved conduit clamps, hangers, supports and fastenings. Arrangement and methods of fastening all conduits shall be subject to Engineer's direction and approval. All conduits shall be rigidly supported (wire supports may not be used in any location). Use only approved clamps on exposed conduit.
2. Conduit in riser shafts shall be supported at each floor level by approved clamp hangers.
3. Right angle beam clamps and U bolts shall be specially formed and sized to snugly fit the outside diameters of conduits.
4. Where installed in seismic zones, suspended raceways shall be braced in two (2) directions as required to prevent swaying and excessive movement.
5. Raceways installed on top of flat roofing shall be supported a minimum of 3 ½" above roof with rubber block supports (Cooper B-Line Dura-Blok or equal). Installation shall be in strict accordance with support manufacturer's instructions and recommendations.

E. Terminations:
1. All conduit connections to sheet metal cabinets or enclosures located in exterior or wet locations shall terminate by use of rain tight (Meyers) hubs.
2. Where rigid or I.M.C. conduits enter sheet metal boxes, they shall be secured by approved lock nuts and bushings.
3. Where metal conduits enter outdoor pull boxes, manholes, under freestanding electrical equipment or other locations where direct metal-to-metal contact does not exist between enclosure and conduit, grounding bushings shall be installed. Each grounding bushing shall be connected to the enclosure ground and all other grounding bushings with properly sized grounding conductors.
4. Where E.M.T. enters sheet metal boxes they shall be secured in place with approved insulating fittings.
5. Where PVC enters outdoor pull boxes, manholes or under freestanding electrical equipment, PVC end bells shall be installed.
6. Contractor shall be responsible for coordinating required conduit sizes with equipment hubs/conduit entry provisions (such as at motor tap boxes) prior to installation of conduit systems. Contractor shall field adjust final conduit sizes at terminations where so required (only as allowed by code) from those indicated on plans to coordinate with equipment hubs/conduit entry provisions.
7. Where conduit terminates in free air such that associated cabling/circuitry becomes exposed (such as at cable trays, etc.), conduit shall generally terminate in a horizontal orientation (to prevent dust/debris/etc. from entering conduit system). Where vertical conduit termination is necessary, the termination shall be provided with cord-grip conduit terminations to seal the conduit system.
8. Conduit ends shall be carefully plugged during construction.
9. Permanent, removable caps or plugs shall be installed on each end of all empty raceways with fittings listed to prevent water and other foreign matter from entering the conduit system.

F. Penetrations:
1. All fire/smoke barrier penetrations shall be made in accordance with a U.L. listed assembly. Refer to drawings and other specifications for additional requirements.
2. All penetrations shall be at right angles unless shown otherwise.
3. Structural members (including footings and beams) shall not be notched or penetrated for the installation of electrical raceways unless noted otherwise without specific approval of the structural engineer.
4. Dry-packed non-shrink grout or watertight seal devices shall be used to seal openings around conduits at all penetrations through concrete walls, ceilings or aboveground floors.
5. All raceways entering structures, or where water is otherwise capable of entering equipment/devices through the raceway system, shall be sealed (at the first box or outlet) with foam duct sealant to prevent the entrance of gases or liquids from one area to another or into equipment/devices.
   a. Where the elevation of the raceway penetration (into the structure) is no more than 15' below the other (higher) end of the same raceway, Polywater FST sealant (rated to hold back up to 22' of continuous water head pressure), or pre-approved equal, shall be used.
   b. Where the elevation of the raceway penetration (into the structure) is between 15' and 75' below the other (higher) end of the same raceway, Polywater PHRD Custom Mechanical Seals (rated to hold back up to 36psi or 83' of continuous water head pressure), or pre-approved equal, shall be used.
   c. Where the elevation of the raceway penetration (into the structure) is more than 75' below the other (higher) end of the same raceway, the contractor shall propose a custom solution designed to hold back or to drain the possible water within the associated raceway. Submittals shall be provided to the engineer for review/approval, including a summary of the anticipated elevations/PSIs, details of the proposed installation, cut-sheets of devices/materials, etc.
6. Additionally, where necessary to ensure that water does not enter equipment/devices through the raceway system (where raceways extend to equipment/devices from wet areas), junction boxes with drain assemblies in bottom shall be located at low point of raceway system near equipment/devices (to drain water out of raceway system before it enters equipment/devices). Contractors shall provide drains in raceway systems where so necessary to prevent water entry into equipment/devices.
7. All raceways passing through concrete roofs or membrane-waterproofed walls or floors shall be provided with watertight seals as follows:
   a. Where ducts are concrete encased on one side: Install watertight entrance seal device on the accessible side of roof/wall/floor as directed by equipment manufacturer.
   b. Where ducts are accessible on both sides: Install watertight entrance seal device on each side of roof/wall/floor as directed by equipment manufacturer.
8. All raceways passing through walls of rooms containing/storing noxious chemicals (chlorine, ammonia, etc.) or through hazardous locations shall be sealed with conduit seals (Crouse-Hinds type EYS or equal).
9. All raceways terminating into electrical enclosures/devices/panels/etc. located in hazardous locations shall be sealed with conduit seals (Crouse-Hinds type EYS, EZS or equal) within 18" of the termination.

G. Exterior Electrical Ductbanks:
1. Where exterior electrical concrete-encased ductbanks are indicated on drawings, conduit runs between buildings or structures shall be grouped in concrete-encased ductbanks as follows:

a. A minimum of 3" of concrete shall encase each side of all ductbanks.
b. A minimum of 1 ½" of separation shall be provided between each conduit within ductbanks. PVC spacers shall be installed at the necessary intervals prior to placement of concrete to maintain the required spacing and to prevent bending or displacement of the conduits.
c. Top of concrete shall be a minimum of 30" below grade. A continuous magnetic marking tape shall be buried directly above each ductbank, 12" below grade.
d. Exact routing of ductbanks shall be field verified and shall be modified as necessary to avoid obstruction or conflicts.
e. Underground electrical raceways shall be installed to meet the minimum cover requirements listed in NEC Table 300.5. Refer to drawings for more stringent requirements.

END OF SECTION 26 05 33

SECTION 26 05 34

OUTLET BOXES, JUNCTION BOXES, WIREWAYS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Outlet and Junction Boxes

B. Pull Boxes

C. Wireways

PART 2 - PRODUCTS

2.1 OUTLET BOXES & JUNCTION BOXES (THROUGH 4-11/16")

A. Sheet Metal: Shall be standard type with knockouts made of hot dipped galvanized steel as manufactured by Steel City, Raco, Appleton, Bowers or equal.

B. Cast: Shall be type FS, FD, JB, GS, or SEH as required for application as manufactured by O-Z/Gedney, Appleton, or equal.

C. Nonmetallic: Shall be type Polycarbonate/ABS construction as required for application with non-metallic quick-release latches as manufactured by Hoffman, O-Z/Gedney, Appleton, or equal.

2.2 JUNCTION AND PULL BOXES (LARGER THAN 4-11/16")

A. Oil-Tight JIC: Shall be Hoffman Type CH box or approved equal.

B. Galvanized Cast Iron or Cast Aluminum: Shall be O-Z/Gedney or approved equal.

C. Stainless Steel: Shall be as manufactured by O-Z/Gedney, Hoffman or approved equal. Boxes shall have continuous hinges, seamless foam-in-place gaskets and screw-down clamps.

D. Nonmetallic: Shall be type Polycarbonate/ABS construction as required for application with non-metallic quick-release latches as manufactured by Hoffman, O-Z/Gedney, Appleton, or equal. Boxes shall have hinged covers and screw-down clamps.

E. Wireways: Shall be standard manufacturer's item as manufactured by Hoffman, Square "D", Burns, B & C or equal. Wireways shall have hinged covers and screw-down clamps.

F. Pre-cast Polymer Concrete Below-Grade Hand Holes & Pull Boxes:
1. Enclosures, boxes and cover are required to be UL Listed and conform to all test provisions of ANSI/SCTE 77 "Specifications For Underground Enclosure Integrity" for Tier 15 applications (15,000lb design load and 22,500lb test load) unless noted otherwise.
2. All covers shall have a minimum coefficient of friction of 0.05 in accordance with ASTM C1028 and the corresponding Tier level shall be embossed on the top surface.

3. Cover shall be bolt-down include factory-labeling to read “Electric”, “Communications” or other as directed.
4. Hardware shall be stainless steel.
5. Shall be Quazite PG/LG Style or approved equal.

G. Galvanized Cast Iron Below-Grade Pull Boxes:
1. Enclosures, boxes and cover are required to conform to AASHTO H-20 requirements for deliberate vehicular traffic applications unless noted otherwise.
2. Cover shall be checkered, bolt-down include factory-labeling to read “Electric”, “Communications” or other as directed.
3. Hardware shall be stainless steel.
4. Shall be furnished with grounding kit.
5. Shall be O-Z/Gedney Type YR or approved equal.
   a.

PART 3 - EXECUTION

3.1 APPLICATION

A. General
1. All boxes and wireways shall be of sufficient size to provide free space for all enclosed conductors per NEC requirements. Fill calculations shall be performed by contractor per NEC requirements.

B. Outlet Boxes & Junction Boxes (through 4-11/16”)
1. Sheet metal boxes shall be used on concealed work in ceiling or walls and exposed work in dry, interior locations
   a. Exception: Where exposed and installed within finished/public spaces such as offices, corridors, lobbies, etc., cast boxes shall be used for wiring device outlets. Cast boxes are not required in back-of-house areas such as electrical rooms, mechanical rooms, etc. .
2. Cast boxes shall be used wherever Rigid or I.M.C. conduits are installed.
3. All boxes installed in extremely corrosive areas (such as chlorine and fluoride storage rooms) where non-metallic raceways are used shall be non-metallic.
4. Except when located in exposed concrete block, switch and receptacle boxes shall be 4" square for single gang installation. Appropriate gang boxes shall be used for mounting ganged switches.
5. When installed in exposed concrete block, switch and receptacle boxes shall be square type designed for exposed block installation.
6. Ceiling outlet boxes shall be 4" octagon 1-1/2" deep or larger required due to number of wires.
7. Boxes installed in hazardous locations shall be explosion-proof rated for the associated application, constructed of copper-free cast aluminum.

C. Junction & Pull Boxes (larger than 4-11/16”)
1. For all below grade exterior use and elsewhere as shown:
   a. In areas subject to future vehicular traffic: shall be galvanized cast iron (rated AASHTO H-20 Loading unless noted otherwise).

b. In areas not subject to vehicular traffic: shall be galvanized cast iron or pre-cast polymer concrete (rated for Tier 15 Loading unless noted otherwise).

2. All boxes installed exposed in exterior or wet areas shall be powder-coated galvanized steel (NEMA 3R).
3. All boxes installed exposed in corrosive areas shall be stainless steel (NEMA 4X).
4. All boxes installed in extremely corrosive areas (such as chlorine and fluoride storage rooms) where non-metallic raceways are used shall be non-metallic.
5. Boxes installed in hazardous locations shall be explosion-proof rated for the associated application, constructed of copper-free cast aluminum.
6. All others shall be oil tight JIC box not less than 16 gauge.

3.2 INSTALLATION

A. General
1. All boxes and wireways shall be securely anchored.
2. All boxes shall be properly sealed and protected during construction and shall be cleaned of all foreign matter before conductors are installed.
3. All boxes and wireways shall be readily accessible. Contractor shall be responsible for furnishing and installing access panels per architect's specifications. Locations shall be as directed by the architect as required to make boxes, wireways, electrical connections, etc. accessible where above gypsum board ceilings or in other similar locations.
4. All metallic boxes and wireways shall be properly grounded.
5. Refer to Specification Section 26 05 53 for identification requirements.

B. Outlet Boxes & Junction Boxes (through 4-11/16")
1. Boxes shall be provided with approved 3/8" fixture studs were required.
2. Recessed boxes for wiring devices, surface fixtures, or connections, shall be set so that the edge of cover comes flush with finished surface.
3. There shall be no more knockouts opened in any sheet metal box than actually used.
4. Any unused opening in cast boxes shall be plugged.
5. Back to back boxes to be staggered at least 3 inches.
6. Under no circumstances shall through-the-wall boxes be used.

C. Junction & Pull Boxes (larger than 4-11/16")
1. Pull boxes shall be installed as indicated on plans and/or as required due to number of bends, distance or pulling conditions.
2. Boxes to be imbedded in concrete shall be properly leveled and anchored in place before the concrete is poured.
3. All pull boxes and/or junction boxes installed exterior below grade, shall have their tops a minimum of 1-1/2 inches above surrounding grade and sloped so that water will not stand on lid. A positive drain shall be installed, to prevent water accumulation inside.
4. Above grade pull boxes shall be installed on concrete anchor bases as shown on Plans.

D. Wireways and/or wall-mounted equipment
1. Mount each wireway to channels of the same metal type as the wireway.
2. Conductors serving a wireway shall be extended without reduction in size, for the entire length of the wireway. Tap-offs to switches and other items served by the wireway shall be made with ILSCO type GTA with GTC cap.

END OF SECTION 26 05 34

SECTION 26 05 36

CABLE TRAYS

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. The work covered under this section consists of the furnishing of all necessary labor, supervision, materials, equipment, tests and services to install complete cable tray systems as shown on the drawings.

B. Cable tray systems are defined to include, but are not limited to straight sections of cable trays, bends, tees, elbows, drop-outs, supports and accessories.

1.2 REFERENCES

A. ANSI/NFPA 70 - National Electrical Code

B. ASTM A123 - Specification for Zinc (Hot-Galvanized) Coatings on Products Fabricated from Rolled, Pressed, and Forged Steel Shapes, Plates, Bars, and Strip

C. ASTM A653 - Specification for Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process, Structural (Physical) Quality

D. ASTM A1011 - Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High Strength Low Alloy with Improved Formability *(Formerly ASTM A570 &A607)*

E. ASTM A1008 – Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability *(Formerly ASTM A611)*

F. ASTM B633 - Specification for Electrodeposited Coatings of Zinc on Iron and Steel

G. NEMA VE 1-2002 - Metallic Cable Tray Systems

H. NEMA VE 2-2006 - Cable Tray Installation Guidelines

I. TIA 569-A – Commercial Building Standard for Telecommunications Pathways & Spaces

1.3 DRAWINGS

A. The drawings, which constitute a part of these specifications, indicate the general route of the cable tray systems. Data presented on these drawings are as accurate as preliminary surveys and planning can determine until final equipment selection is made. Accuracy is not guaranteed and field verification, of all dimensions, routing, etc., is directed.

B. Specifications and drawings are for assistance and guidance, but exact routing, locations, distances and levels will be governed by actual field conditions. Contractor is directed to make field surveys as part of his work prior to submitting system layout drawings.

1.4 SUBMITTALS

A. Submittal Drawings: Submit drawings of cable tray and accessories including clamps, brackets, hanger rods, splice plate connectors, expansion joint assemblies, and fittings, showing accurately scaled components.

B. Product Data: Submit manufacturer's data on cable tray including, but not limited to, types, materials, finishes, rung spacings, inside load depths and fitting radii. For side rails and rungs, submit cross sectional properties including Section Modulus (Sx) and Moment of Inertia (Ix).

1.5 QUALITY ASSURANCE

A. Manufacturers: Firms regularly engaged in manufacture of cable trays and fittings of types and capacities required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Provide cable trays and accessories through one source from a single manufacturer.

C. NEMA Compliance: Comply with NEMA Standards Publication Number VE1, "Cable Tray Systems".

D. NEC Compliance: Comply with NEC, as applicable to construction and installation of cable tray and cable channel systems (Article 318, NEC).

E. UL Compliance: Provide products that are UL-classified and labeled in their final installed form.

F. NFPA Compliance: Comply with NFPA 70B, "Recommended Practice for Electrical Equipment Maintenance" pertaining to installation of cable tray systems.

1.6 DELIVERY, STORAGE AND HANDLING

A. Deliver cable tray systems and components carefully to avoid breakage, denting and scoring finishes. Do not install damaged equipment.

B. Store cable trays and accessories in original cartons and in clean dry space; protect from weather and construction traffic. Wet materials should be unpacked and dried before storage.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Wire Mesh Basket type cable tray systems:
1. Subject to compliance with these specifications, wire mesh basket type cable tray systems shall be as manufactured by Eaton B-Line, Inc.; Mono-Systems, Inc, Chalfant or Legrand Cablofil.

2.2 CABLE TRAY SECTIONS AND COMPONENTS

A. Typical Cable Tray Application (applicable unless noted otherwise on plans):

1. Containing only low voltage cabling AND concealed above accessible ceilings, below raised access floors or within telecommunications rooms: Wire mesh basket type with:
   a. Useable Loading Depth: 4".
   b. Minimum Load Rating: NEMA 12C.
   c. Material: Black powder coat painted steel.
   d. Width(s): as shown on plans.
2. All other applications: Ladder-type with:
   a. Rung Spacing:9" o.c.
   b. Useable Loading Depth: 4".
   c. Minimum Load Rating: NEMA 12C.
   d. Material: Aluminum.
   e. Width(s): as shown on plans.

B. General: Except as otherwise indicated, provide metal cable trays, of types, classes and sizes indicated; with clamp assemblies, connector/splice plates, splice bars, bolts, nuts and washers for connecting units as required. Construct units with rounded edges and smooth surfaces; in compliance with applicable standards.

C. Cable tray construction:
1. Wire Mesh Basket type cable tray systems:
   a. All straight section longitudinal wires shall be constructed with a continuous top wire safety edge. Safety edge must be kinked and T-welded on all tray sizes.
   b. Wire mesh basket type cable tray shall be made of high strength steel wires and formed into a standard 2 inch by 4 inch wire mesh pattern with intersecting wires welded together. Minimum wire diameter shall be 5mm (4.5mm for stainless steel). All mesh sections must have at least one bottom longitudinal wire along entire length of straight section.
   c. All fittings shall be factory-built or shall be formed from straight sections in accordance with manufacturer's instructions to maintain the UL Classification of the system.

D. Materials and Finish: Specific material and finish types for each tray type (as specified elsewhere) shall comply with the following general requirements:
1. Aluminum: All sections and fitting side rails and rungs shall be extruded from Aluminum Association Alloy 6063. All fabricated parts shall be made from Aluminum Association Alloy 5052.
2. Pre-galvanized Steel: All sections, fitting side rails, rungs, and covers shall be made from steel meeting the minimum mechanical properties and mill galvanized in accordance with ASTM A653 SS, Grade 33, coating designation G90.
3. Hot-dip Galvanized Steel: All sections and fitting side rails and rungs shall be made from steel meeting the minimum mechanical properties of ASTM A1011 SS, Grade 33 for 14 gauge and heavier, ASTM A1008, Grade 33, Type 2 for 16 gauge and lighter and ASTMA510, Grade 1008 for wire mesh basket type, and shall be hot-dip galvanized after fabrication in accordance with ASTM A123. All covers and splice plates must also be hot-dip galvanized after fabrication; mill galvanized covers are not acceptable for hot-dipped galvanized cable tray. All hot-dip galvanized after fabrication steel cable trays must be returned to point of manufacture after coating for inspection and removal of all icicles and excess zinc. Failure to do so can cause damage to cables and/or injury to installers.
4. Stainless Steel: All sections, accessories and fitting side rails and rungs shall be made of AISI Type 316 stainless steel. Transverse members (rungs) or corrugated bottoms shall be

welded to the side rails with Type 316 stainless steel welding wire. Wire mesh basket type shall meet minimum mechanical properties of ASTM A580.

5. Black Powder Coated steel: All sections/components shall be powder coated black with an average paint thickness of 1.2mils (30microns) to 3.0mils (75microns).

E. Accessories and Supports:

1. General:
   a. Cable Tray Supports: Shall be placed so that the support spans do not exceed maximum spans allowed to achieve the specified cable tray load ratings.
   b. Center hung supports shall be manufactured of 12 gauge, 1-5/8 inch by 1-5/8 inch B-Line B22 steel strut with a pipe welded at the middle of the support to provide eccentric loading stability. Support shall withstand 700 pounds in a 60 percent vs. 40 percent eccentric loading condition with a safety factor of 3.
   c. Accessories - special accessories shall be furnished as required to protect, support, and install a cable tray system. Accessories shall consist of but are not limited to; section splice plates, expansion plates, blind-end plates, specially designed ladder dropouts, barriers, conduit-to-tray adapters, etc.
2. Wire Mesh Basket type cable tray systems:
   a. Barrier Strips: Shall be provided where specified on plans or where cables/conductors of varying voltage classes are installed within the same tray (per NEC requirements), shall be manufactured by the tray system supplier and shall be fastened into the tray as directed by the tray system supplier.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General:

1. Installers of wire mesh basket type cable tray systems shall be certified by the supplier of the cable tray system.
2. Install cable trays as indicated: Installation shall be in accordance with:
   a. Equipment manufacturer's instructions.
   b. Recognized industry practices.
   c. NEC (Article 392 and others).
   d. Applicable portions of NFPA 70B.
   e. NEMA-VE2.
3. All cable and equipment shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the contract documents shall be subject to the control and approval of the owner or owner’s representative.
4. Coordinate cable tray installation with other work as necessary to properly interface installation of cable tray with other work.

B. Cabling:

1. All cabling/conductors routed in cable tray shall be rated for cable tray application.
2. Cabling/conductors of varying voltage classes installed within common trays shall be separated by barrier strips per NEC requirements.
3. Cable/conductor securing:
   a. Cables/conductors shall be secured to the transverse elements of the associated trays at the following minimum intervals:

1) Seismic, high-shock or vibration prone areas (such as mechanical rooms, process areas, etc.):
   a) All cables/conductors: 24".
2) Non-horizontal cable tray sections:
   a) All cables/conductors: 36".
3) Horizontal cable tray sections:
   a) All power cables/conductors: 36"
   b) Control, instrumentation and network cables in cable trays in exposed areas: 36"
   c) Control, instrumentation and network cables in cable trays in concealed interior areas (such as above lay-in ceilings): No cable ties required.

b. All cable ties used to secure cables to trays in interior areas shall be plenum-rated plastic. Cable ties used in interior exposed areas (subject to light) in interior areas shall be sunlight/UV-resistant. Cable ties used in exterior environments shall be of non-magnetic stainless steel construction.

4. Cable/conductor arrangement:
   a. Provide separation between power cables/conductors within cable trays for proper heat dissipation (and conductor ampacity ratings) per NEC requirements.

C. Bonding:
1. Ground and bond metal cable tray in accordance with NEC Articles 392, 250.96 and 250.102.
   a. Provide continuity between all metal cable tray components.
   b. Make connections to tray using mechanical, compression or exothermic connectors.
2. Cable trays shall be properly bonded with grounding harnesses or other necessary equipment as required to all metal conduits terminating into the cable trays and between cable tray sections.

D. Location/Routing:
1. Location of cable tray shown on plans is for general routing only. Field coordinate exact cable tray locations/routing with all piping, equipment, ductwork, structure, lighting, etc. & other trades prior to ordering cable tray. Provide vertical & horizontal bends as required, maintaining proper clearance around cable trays.
2. Coordinate cable tray with all other work as necessary to properly integrate installation of cable tray work with other work. Any potential conflicts between locations of cable trays and locations of other items shall promptly be brought to the attention of the engineer prior to installation.
3. Provide a minimum of 6" clearance on top of cable trays and 3" clearance on bottom and sides of cable trays to permit access for installing and maintaining cables unless specifically approved or directed otherwise by engineer.

E. Support:
1. Cable tray fitting supports shall be located such that they meet the strength requirements of straight sections. Install fitting supports per NEMA VE-2 guidelines, or in accordance with manufacturer's instructions.
2. Trapeze hangers and center-hung supports shall be supported by 1/2 inch (minimum) diameter all-thread rods unless noted otherwise. Trapeze hangers supporting wire mesh basket type cable trays 12" wide or less may be supported by 3/8 inch (minimum) diameter all-thread rods.

F. Penetrations:
1. Where cable trays pathways pass through walls, floors, ceilings or other similar partitions that are fire-rated, smoke-rated, designed to prevent water entry, designed to limit sound transmission, or designed to limit air passage (for environmental or conditioning purposes), cable trays themselves shall not penetrate the partition but shall be terminated on either side of the partition. The partition shall be penetrated with conduit sleeves sealed with suitable fire caulk or other approved material, per specific instructions of the caulk supplier to maintain partition/etc. ratings (such as fire or smoke ratings), after installation of all cabling. Bonding jumpers shall be provided through sleeves to ensure electrical continuity of cable tray system. Interior cross-sectional area of the conduit sleeves shall match or exceed the interior cross-sectional area of the associated cable tray(s).
2. Contractor shall verify arrangement, sizes and locations of all penetrations through load-bearing walls, floors or other structural items with structural engineer. Contractor shall submit sketch of proposed sleeve locations to structural engineer for review prior to rough-in.

G. Marking:
1. Cable trays containing conductors rated over 600 volts shall have a permanent, legible warning notices installed per NEC 392 requirements.

3.2 TESTING

A. Test cable trays to ensure electrical continuity of bonding and grounding connections. See NFPA 70B, Chapter 18, for testing and test methods.

B. Manufacturer shall provide test reports witnessed by an independent testing laboratory of the "worst case" loading conditions outlined in this specification and performed in accordance with the latest revision of NEMA VE-1; including test reports verifying rung load capacity in accordance with NEMA VE-1 Section 5.4.

END OF SECTION 26 05 36

SECTION 26 05 53

ELECTRICAL IDENTIFICATION

PART 1 - GENERAL

1.1 DESCRIPTION

A. Wire and cable identification.

B. Pullbox & Junction Box Identification

C. Electrical distribution & utilization equipment identification.

D. Emergency and Standby Power receptacle identification.

PART 2 - PRODUCTS

2.1 WIRE AND CABLE IDENTIFICATION

A. Intermediate Locations:
1. Wires and cable labels shall be white, thermal transfer, halogen-free, flame-retardant marker plates (sized to accommodate three lines of text) permanently affixed to the associated cable with UV-resistant plastic wire ties. Labels shall be Panduit #M200X/300X series or equal.

B. Circuit/Cable Termination Locations:
1. Wires and cable labels shall be non-ferrous identifying tags or pressure sensitive labels unless noted otherwise.

2.2 ELECTRICAL DISTRIBUTION & UTILIZATION EQUIPMENT IDENTIFICATION

A. Labels on electrical distribution & utilization equipment shall be black-on-white engraved Bakelite nameplates permanently affixed to the equipment with rivets or silicone adhesive unless noted otherwise.

B. Labels on electrical distribution equipment fed from emergency or legally-required standby sources (such as emergency generators) shall be white-on-red engraved Bakelite nameplates permanently affixed to the equipment with rivets or silicone adhesive.

2.3 EMERGENCY AND STANDBY POWER RECEPTACLE IDENTIFICATION

A. Receptacles fed from emergency or standby power sources (such as emergency generators) shall be provided with factory-marked engraved coverplates as follows:
1. Emergency System source: Red engraved lettering to read “EMERGENCY”.
2. Legally-Required or Optional Standby Generator source:
   a. If only part of facility is fed with generator backup: Black engraved lettering to read “FED FROM GENERATOR”.
   b. If entire facility is fed with generator backup: No “….GENERATOR…” label required.

PART 3 - EXECUTION

3.1 GENERAL

A. Any proposed deviation in identification methods and materials from those described herein shall be submitted to Architect for review and comment prior to installation.

B. Contractor shall provide all labeling or identification required by applicable local, state and national codes. These specifications do not intend to itemize all code-required labeling or identification requirements.

C. All labels/identification shall be positioned such as to be readable from the normal perspective without adjusting wiring/cables/labels. For example, labels/identification of wires/cables within cable trays shall be positioned to point towards the viewer (typically downward for overhead cable trays, or upward for cable trays within trenches).

D. All labels/identification (except for handwritten labels on concealed pullbox/junction box covers as noted below) shall be typewritten/printed/engraved in a neat, workmanlike, permanent, legible, consistent and meaningful manner. Labels shall not be handwritten unless specific approval is granted by engineer.

3.2 WIRE AND CABLE IDENTIFICATION

A. General:
1. Where cabling is exposed (such as within cable trays), provide two wire ties per cable (one on either end of marker plate to provide a flush installation). Where cabling is concealed (such as within pullboxes/wireways), one wire tie per cable will be acceptable.

B. Intermediate Locations:
1. Thermal transfer labels shall be securely fastened to all wiring and cabling in the following locations:
    a. Wireways
    b. Pullboxes/Junction boxes larger than 4-11/16”
    c. Pullboxes/Junction boxes through 4-11/16” where wires and cables are not easily identifiable via the color coding and box labeling
    d. Vaults & Manholes
    e. Approximately every 50 feet within cable trays (especially at locations where cables exit or diverge). Labels within cable trays shall be grouped (rather than being pre-labeled on cables and pulled into cable trays).
    f. Other similar intermediate locations.
2. Labels shall be stamped or printed with the following data so that the feeder or cable can be readily identified and traced:
    a. From where the circuit originates (including panel designation and circuit number):
        1) Ex: “FROM: PP-A CIR. 3 (IN MAIN ELEC ROOM)”
    b. To where the circuit extends (using the common name of the equipment):
        1) Ex: “TO: RTU-6 (ON ROOF)”
    c. The purpose of the circuit:
        1) Ex: “POWER”
    d. The set number (If parallel power feeds are used).
        1) Ex: “SET NO. 3 OF 4”

C. Circuit/Cable Termination Locations:
1. Where multiple termination points exist within a circuit origination point (panelboard, switchboard, MCC, starter, etc.) or other similar circuit endpoint (control panel, etc.), labels shall be securely fastened to all ungrounded and neutral conductors to clearly identify the terminal and/or circuit number associated with each conductor. For example, within lighting panels, each phase and neutral conductor shall be labeled near the terminals at a clearly visible location with the associated circuit number(s), so that if all conductors were unterminated, the labels would clearly indicate which conductor was associated with each circuit.

D. Refer to Specification Section 26 05 19 for all color-coding requirements of wires and cables.

3.3 PULLBOX & JUNCTION BOX IDENTIFICATION

A. Concealed pullboxes/junction boxes:
1. Front surface of all pullbox/junction box covers in concealed areas (such as above lay-in ceilings) or within mechanical/electrical rooms (and other similar areas where appearance of boxes is not an issue) shall be neatly marked with the ID of circuits/cables contained with permanent black marker on cover of box (Ex: “RP-1A Cir. 1, 2 & 3”). Additionally, front surface of box shall be painted red where box contains fire alarm system cabling.

B. Exposed pullboxes/junction boxes:
1. Interior surface of all pullbox/junction box covers in exposed areas shall be labeled “Power”, “Telecommunications”, “Fire Alarm” or with other similar general text neatly with permanent black marker to indicate function of box. Circuit/cable labeling within box (see above) shall identify specific cables contained. Additionally, interior surface of cover shall be painted red where box contains fire alarm system cabling.

C. Where pullboxes/junction boxes are named on contract documents (Ex:”PULLBOX #3”), an engraved nameplate shall be installed on the front surface of the box to identify the name.

3.4 ELECTRICAL DISTRIBUTION & UTILIZATION EQUIPMENT IDENTIFICATION

A. General:
1. All new and existing equipment modified by this project shall include arc-flash warning labels in accordance with NEC article 110.16.

B. All Panels, Motor Control Centers, Switchboards, Switchgear, Transformers, Etc.:
1. Engraved nameplates identifying name of equipment, nominal voltage and phase of the equipment and where the equipment is fed from shall be installed on front surface of all panels, motor control centers, switchboards, switchgear, transformers, etc.:
   a. Ex: First Line: “NAME: RP-A”, Second Line: “120/208V-3Ø-4W”, Third Line: “FED FROM: PP-A CIR. 4 (IN MAIN ELEC ROOM)”
2. Refer to Panelboard Specification Sections for additional labeling requirements (circuit directory cards, permanent circuit labels, permanent circuit numbers, etc.) required inside panelboards.

C. Safety/Disconnect Switches and Utilization Equipment (HVAC Equipment, Pumps, Powered Valves, Control Panels, Starters, Etc.)::
1. Engraved nameplates identifying equipment being fed and where the equipment is fed from shall be installed on front surface of all disconnect switches (including both visible blade

type switches and toggle-type switches) and on utilization equipment (where not clearly identified by immediately adjacent local disconnect switch):
   a. Ex: First Line: "RTU-6", Second Line: "FED FROM: PP-A CIR. 5"
2. Where safety/disconnect switches are installed on the load side of variable frequency drives, the safety/disconnect switch shall be furnished with an additional engraved nameplate to read: "WARNING: TURN OFF VFD PRIOR TO OPENING THIS SWITCH".
3. Safety/Disconnect switches feeding equipment that is fed from multiple sources (such as motors with integral overtemperature contacts that are monitored via a control system) and Utilization Equipment fed from multiple sources shall be furnished with an additional BLACK-ON-YELLOW engraved nameplate to read: "WARNING: ASSOCIATED EQUIPMENT FED FROM MULTIPLE SOURCES – DISCONNECT ALL SOURCES PRIOR TO OPENING COVER".

D. Emergency Systems:
1. A sign shall be placed at the service entrance equipment (and at any remote shunt trip operators, or similar, for service equipment) indicating the type and location of on-site emergency power sources (such as generators, central battery systems, etc.) per NEC requirements.
2. All boxes and enclosures (including transfer switches, generators, power panels, junction boxes, pullboxes, etc.) dedicated for emergency circuits shall be permanently marked with white-on-red engraved nameplates so they will be readily identified as a component of an emergency circuit or system.
3. Where an Essential Electrical System (EES) is installed, all enclosures, raceways and equipment that are components of the EES shall be readily identified as such. Raceway shall be identified at intervals not exceeding 25 ft.

E. Services:
1. All Service Equipment:
   a. Engraved nameplates identifying maximum available fault current, including date the fault current calculation was performed, in accordance with NEC article 110.24.
      1) Ex: First Line: "AVAILABLE FAULT CURRENT: 16,154 AMPS", Second Line: "DATE CALCULATED: JULY 8, 2013"
   b. All service entrance equipment shall be clearly labeled as being service entrance rated.
2. Where a building or structure is supplied by more than one service (or any combination of branch circuits, feeders and services), a permanent plaque or directory shall be installed at each service disconnect location denoting all other services, feeders & branch circuits supplying that building or structure and the area served by each, per NEC requirements.

F. Generators:
1. Generators shall be labeled with engraved nameplates identifying name of equipment.

3.5 EMERGENCY AND STANDBY POWER RECEPTACLE IDENTIFICATION

A. Receptacles fed from emergency or standby power sources (such as emergency generators) shall be provided with factory-marked engraved coverplates as described above.

3.6 OTHER IDENTIFICATION

A. Factory-engraved coverplates identifying functions of light switches and other similar devices shall be installed where so required by plans/specifications.

END OF SECTION 26 05 53

SECTION 26 09 43

LIGHTING CONTROL SYSTEM

PART 1 - GENERAL

1.1 INTRODUCTION

A. The work covered in this section is subject to the requirements in the General Conditions of the Specifications. Contractor shall coordinate the work in this section with the trades covered in other sections of the specification to provide a complete and operable system.

1.2 SYSTEM DESCRIPTION

A. Extent of lighting control system work is indicated by drawings and by the requirements of this section. Contractor shall furnish and install a complete, integrated, stand alone automatic lighting control system including programmable Lighting Control Panels with internal astronomic timeclock(s), Networking between panels, Dataline low voltage control switch inputs for zone control, Photocell input for outdoor lighting control, Occupancy Sensors, and Daylighting Controls from a single supplier. Contractor is responsible for confirming that the panels and sensors interoperate as a single system.

1.3 QUALITY ASSURANCE

A. Manufacturers: Firms regularly engaged in the manufacture of lighting control equipment and ancillary equipment, of types and capacities required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Comply with NEC, NEMA, and FCC Emission requirements for Class A applications.

C. UL Approvals: Relay panels and accessory devices are to be UL listed under UL 916 Energy Management Equipment. Configured to order or custom relay panels shall be UL Listed under UL 508, Industrial Control Panels.

1.4 SUBMITTALS

A. Submittals Package: Submit the shop drawings, and the product data specified below at the same time as a package.
   1. Shop Drawings: Building floorplans showing all proposed devices and composite wiring and/or schematic diagram of each control circuit as proposed to be installed (standard diagrams will not be accepted).
   2. Product Data: Catalog sheets, specifications and installation instructions.

1.5 APPROVED MANUFACTURERS

A. Watt Stopper/Legrand – Lighting Integrator series

B. Equal by Acuity Lighting

C. Any other system wishing to be considered must submit descriptive information 10 days prior to bid. Prior approval does not guarantee final approval by the electrical engineer. The contractor shall be completely responsible for providing a system meeting this specification in its entirety.

All deviations from this specification must be listed and individually signed off by the consultant.

PART 2 - PRODUCTS

2.1 LIGHTING CONTROL PANELS

A. Provide lighting control panels in the locations and capacities as indicated on the plans and schedules. Each panel shall be of modular construction and consist of the following components:

1. Enclosure/Tub shall be NEMA 1, NEMA 3R, or NEMA 4 as indicated on the plans, sized to accept an interior with 1-8 relays, 1-24 relays and six (6) four pole contactors, or 1-48 relays with six (6) four pole contactors, per enclosure. Multiple enclosures shall be provided where required for the specified quantities of relays/contactors.
2. Cover shall be configured for surface or flush wall mounting of the panel as indicated on the plans. The panel cover shall have a hinged and lockable door with restricted access to line voltage section of the panel.
3. Interior assembly shall be supplied as a factory assembled component specifically designed and listed for field installation. The interior construction shall provide total isolation of high voltage (class 1) wiring from low voltage (class 2) wiring within the assembled panel. The interior assembly shall include intelligence boards, power supply, DIN rails for mounting optional Class 2 control devices, and individually replaceable latching type relays. The panel interiors shall include the following features:
    a. Provision for one or two optional control and automation cards.
    b. Removable, plug-in terminal blocks with screw less connections for all low voltage terminations.
    c. Individual terminal block, override push button, and LED status light for each relay
    d. Switch inputs associated with each relay and group channel shall support two or three wire, momentary or maintained contact switches or 24VDC input from occupancy sensors.
    e. Automatic support for occupancy sensor sequence of operation. Low voltage inputs automatically reconfigure when connected to a Watt Stopper occupancy sensor head. Occupancy sensor shall switch lighting on and off during unoccupied periods but shall not turn lighting off during scheduled occupancy periods.
    f. Isolated contacts within each relay shall provide true relay state to the electronics. True relay state shall be indicated by the on-board LED and shall be available to external control devices and systems.
    g. Automatic sequenced operation of relays reduces impact on the electrical distribution system when large loads are controlled simultaneously.
    h. Group, channel, and pattern control of relays shall be provided through a simple button-press interface within the panel. Any group of relays can be associated with a channel for direct on/off control or pattern (scene) control via a simple programming sequence using the relay and channel override push buttons and LED displays.
    i. Relay group status for each channel shall be provided through bi-color operation of the LED indicators. Solid red indicates that all relays in the group are on, solid green indicates that the group is in a mixed state, and blinking green indicates that the relays have blink warned and are currently timing out.

j. Each relay and channel terminal block shall provide a 24V pilot light signal. It shall be possible to configure the system for support for any Class 2 pilot light voltage with the use of an auxiliary power supply.
k. Single pole latching relays with modular plug-in design. Relays shall provide the following ratings and features:
   1) Electrical:
      a) 30 amp ballast at 277V
      b) 20 amp ballast at 347V
      c) 20 amp tungsten at 120V
      d) 30 amp resistive at 347V
      e) 1.5 HP motor at 120V
      f) Short circuit current capacity equal to (or greater than) that of the associated circuits (see associated panelboard schedules on drawings)
   2) Mechanical:
      a) Individually replaceable, ½" KO mounting with removable Class 2 wire harness
      b) Actuator on relay housing provides manual override and visual status indication, accessible from Class 2 section of panel
      c) Dual line and load terminals each support two #14 – #12 solid or stranded conductors
      d) Tested to 300,000 mechanical on/off cycles
   3) Isolated low voltage contacts provide for true relay status feedback and pilot light indication.
l. Power supply shall be a multi-voltage transformer assembly with rated power to supply all electronics, occupancy sensors, switches, pilot lights, and photocells as necessary to meet the project requirements. Power supply to have internal over-current protection with automatic reset and metal oxide varistor protection.

2.2 LONWORKS® BASED DIGITAL COMMUNICATIONS

A. The lighting control panel shall support digital communications to facilitate the extension of control to include multiple panels and other intelligent field devices. Digital communications shall be LonWorks® based and use the LonTalk® protocol in an open topology architecture.
   1. Dataline communications wire shall be 18 AWG, 4 unshielded copper conductors (two independent twisted pairs) meeting Class 2P NEC code requirements. The dataline shall be topology free and can be run in a serial, "T"or star configuration.
   2. The Dataline wire will be supplied by the equipment manufacturer and will include the manufacturers name, catalog number printed on the wire jacket. The contractor, at their own expense will, replace an improper dataline wire.
   3. Panels shall be digitally addressed and support bi-directional communication between each other and other intelligent field devices specified elsewhere.
   4. Intelligent field devices supported shall include digital dataline switches, network clock/programmer, telephone interface module, BMS interface module, photocell control module, programmable thermostat, and universal switch module.

2.3 BROWSER BASED PROGRAMMING AND CONTROL

A. The lighting control system shall include a web browser based user interface that shall allow programming and override of the system from any PC browser with network connectivity to the lighting controls. The Automation Appliance shall include as a minimum the following

features:

1. The interface shall be a TCP/IP based server device that is connected to the lighting control system global dataline and shall not require that software be installed on the client PC(s) for operation.
2. Provide support for connection of one or more personal computers directly via Ethernet or enterprise connectivity via a local area network, wide area network or internet connection.
3. Provide the option for a plug-in 56K baud modem to enable dial in connection via standard telephone line. All functionality of the browser interface shall be available through the dial-up connection.
4. Log in to the lighting control system through the browser interfaced shall provide multi-level security. Users shall be assigned log in access levels to restrict program modification to authorized users.
5. User programming shall include eight independent schedules for each lighting control panel, as well as, eight global schedules that affect channels in all panels on the network. Schedules shall overlap such that a panel specific schedule for any channel will override a global schedule for that channel.
6. Schedules shall be capable of seven day repeating and calendar date event based formats.
7. User programming shall be scenario based and shall include the following options:
   a. Scheduled ON / OFF
   b. Manual ON / Scheduled OFF
   c. Manual ON / Auto Sweep OFF (for AS-100 Switches)
   d. Astro ON / OFF (or Photo ON / OFF)
   e. Astro and Schedule ON / OFF (or Photo and Schedule ON / OFF)
8. It shall be possible to view the status of and override any relay or channel group via the browser interface screens.
9. Provide support and user interface screens for integration of the photocontrol module, dataline switches, touch-tone telephone module, and universal switch module.
10. Provision for integration with the building automation system shall be via the industry standard BACnet protocol. Any of the eight global schedule channels shall individually be set to follow the BAS schedules rather than the internal Automation Appliance schedules. Relays in all panels shall be exposed to the BAS as binary output objects. It shall be possible for the BAS to read the status of each relay and to override each relay via BACnet.
11. The interface shall monitor all networked components and automatically generate alarms if any component fails to properly respond to control. Alarms shall be annunciated via the browser screens and via email to selected recipients where a proper SMTP server connection has been set up.
12. The user programming in the lighting control panels and dataline switches shall be available for viewing or download to the client PC as a standard PDF file.
13. A backup function shall permit the complete system program to be saved to the hard drive of any client PC connected to the lighting control system through the browser interface. A restore function shall allow a saved program to be reloaded to the interface.

2.4 EIGHT CHANNEL DIGITAL PHOTOCONTROL MODULE

A. Provide a weatherproof Class 2 photocell for measuring exterior light levels. The photocell shall be mounted facing north as indicated on the plans. The photocell shall be connected to a photocontrol module mounted on the DIN rail inside the low voltage section of a lighting control panel and connected to the dataline communications wire.

1. The photocontrol Module shall integrate seamlessly with either the Network Clock, Automation Appliance, or the BMS Interface Module. The control module shall measure the actual exterior light and display this level in foot candles (fc) on the unit LCD display.
2. The controller shall have eight individual set point adjustments that are available to the lighting control network over the dataline communications wire.
3. Features
   a. Real time, 2 line LCD display of actual exterior light level up to 200 fc.
   b. Channel set points and parameters programmed via the Network Clock or BMS Interface Module.
   c. Choice of OPERATE or TEST modes, with simulated light level for testing.
   d. Automatic dead band and 5 minute time delay to avoid cycling.

2.5 DIGITAL DATALINE SWITCHES

A. Intelligent digital switching shall be provided operating on the dual twisted pair communication wire. Switches shall be available in single, dual, quad, or octal (1-button, 2-button, 4-button, or 8-button) designs. The single, dual, and quad devices shall mount in a standard single-gang box, the octal version in a two-gang box.
   1. Each button shall be individually programmable. Programming of buttons shall not require the use of a computer or other programming device. It shall be possible to assign relays or channels to buttons using a simple button press interface. Each button can control any one of the following options:
      a. Any individual relay in any single panel.
      b. Any group of relays in any single panel.
      c. Any group of relays in the system (via network clock, Automation Appliance, or WinControl software package).
   2. For applications that require pattern switching, buttons shall function as a scene control using an ON/OFF/Not Controlled pattern of relays instead of the normal All ON/OFF.
   3. Switches shall be constructed of non-breakable grey Lexan on all exposed parts and shall include a stainless steel wall plate, unless noted otherwise on plans.
   4. Individual buttons shall have a removable clear cover to allow standard 9 mm (3/8 inch) labeling tape to be used to identify the controlled loads.
   5. Each switch shall use a bi-color LED pilot light for the individual buttons to indicate status of the controlled relay or group of relays. LED indications are Red for All ON, Green for Mixed State (some relays in the group ON and others OFF), and No LED for All OFF.
   6. Switch LED pilot lights shall flash green to indicate impending off sweep during the five-minute grace period following blink warning of the lights. Once the button is pressed, the LED will change to Red to acknowledge the occupant's override command to keep lights ON.
   7. Multiple dataline switches programmed to control the same relay or relay group shall indicate the same status automatically.
   8. Each switch shall also include a locator light illuminating the switch for easy location in the dark.
   9. The dual, quad, and octal switches shall all include a single master button that will override all relays controlled by the individual buttons OFF, or Restore them to their original state. Each switch's master button configuration can be altered to perform a Master ON/OFF, OFF Only, or Disabled function if desired.
   10. Switches can be configured to follow a "Cleaning" scenario. This specific scenario shall prevent the cleaners from overriding OFF any relays previously turned ON by an occupant.

11. Each switch is available in a Key lock override version. Once a key is inserted, the individual buttons will function for five minutes.

2.6 AUTOMATIC LIGHTING CONTROLS

A. System shall provide automatic lighting shutoff for all interior lighting circuits controlled by the system (excluding night lights and other similar circuits) per latest ASHRAE 90.1 & IECC standards, unless specifically shown otherwise on plans.

B. System shall provide blink-warnings for interior lighting circuits (excluding circuits with HID light fixtures) controlled by the control panel 5 minutes prior to automatic shutoff.

C. System shall include provisions for holiday scheduling, to allow automatic “ON” programming to be skipped on holidays and other scheduled off days per applicable energy code requirements.

D. Low voltage remote override switches shall be provided as shown on drawings.

E. Exact preset times for lighting control zone controls (where applicable) and lighting control system operation shall be per owner’s direction. Contractor shall submit a proposed lighting control schedule indicating type of “ON” control (occupancy, time-of-day, manual, etc.), type of “OFF” control (occupancy, time-of-day, manual, etc.) and proposed preset times for all zones to owner for review prior to implementation. The following general control schemes shall generally be used where the owner has no preferences unless shown otherwise on plans:
1. Exterior Security Lighting (at doorways, etc.):
    a. On: Photocell or Astronomic – dusk.
    b. Off: Photocell or Astronomic – dawn.
2. Other Exterior Lighting:
    a. On: Photocell or Astronomic – dusk.
    b. Off: Preset Time (as directed by the facility operator).
3. Interior Lighting with Occupancy Sensor Controls:
    a. Corridors, restrooms, lobbies and other similar public spaces
        1) On: Occupancy Sensor.
        2) Off: Occupancy Sensor.
    b. Storage rooms, janitor's closets, telecommunications rooms, and other similar unoccupied spaces:
        1) On: Occupancy Sensor.
        2) Off: Occupancy Sensor.
    c. Offices, classrooms, breakrooms, conference rooms, work areas, kitchens, gymnasiums, and other similar occupied spaces:
        1) On:
            a) Manual Local Switch (if digital controls are provided) or
            b) Occupancy Sensor (if hardwired controls are provided).
        2) Off: Occupancy Sensor (A "grace period" shall be provided, in which the occupancy sensor can turn lights back "on" for a short period of time (approximately 15 seconds) after lights are turned off automatically).
4. Interior Lighting with Time-of-Day Controls:
    a. Corridors, restrooms, lobbies and other similar public spaces
        1) On: Preset Time (as directed by the facility operator).
        2) Off: Preset Time (as directed by the facility operator).

b. Storage rooms, janitor's closets, telecommunications rooms, and other similar unoccupied spaces:
   1) On: Manual Local Switch
   2) Off: Preset Time (as directed by the facility operator).
c. Offices, classrooms, breakrooms, conference rooms, work areas, kitchens, gymnasiums, and other similar occupied spaces:
   1) On: Manual Local Switch
   2) Off: Preset Time (as directed by the facility operator).

2.7 WIRING

A. See Specification Section 27 05 00 for additional requirements.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Refer to Specification Section 27 05 00 for additional cable installation requirements.

B. Master/centralized lighting control switches (particularly switches located in areas where not all associated lighting fixtures are visible from the switch) and individual buttons of other lighting control stations with more than two (2) buttons shall be labeled (on switch coverplate or directly on buttons) with factory-engraved labeling. Exact wording of labeling shall be per owner's direction unless shown otherwise on plans.

3.2 SUPPORT SERVICES

A. Pre-installation Coordination
1. Exact occupancy sensor and daylight sensor types and locations shall be determined by the lighting control system supplier for a fully-functional system with adequate coverage throughout areas controlled by occupancy sensors. Exact locations shall be coordinated with actual HVAC register locations, furniture/casework/etc. locations, sensor coverage patterns, etc. for proper coverage in all areas. In no case may fewer devices or lower-quality devices be used in each area than indicated on contract documents.

B. System Start Up and Commissioning
1. The electrical contractor shall provide the manufacturer, the facility owner and the electrical engineer with ten working days written notice of the system startup and adjustment date.
2. Manufacturer shall provide a factory authorized technician to confirm proper installation and operation of all lighting control system components. The startup requirement is intended to verify:
   a. That all occupancy and daylighting sensors are located, installed, and adjusted as intended by the factory and the contract documents.
   b. The occupancy sensors and daylighting sensors are operating within the manufacturers specifications.
   c. The sensors and relay panels interact as a complete and operational system to meet the design intent.
3. Manufacturer to provide a written statement verifying that the system meets the above requirements.

C. Re-commissioning – After 30 days from occupancy re-calibrate all preset times, sensor time

delays and sensitivities and relocate occupancy sensors if so required to meet the Owner's Project Requirements. Provide a detailed report to the Design Team and Owner of re-commissioning activity.

D. System Training
1. Manufacturer shall provide factory authorized technician to train owner personnel in the operation, programming and maintenance of the lighting control system including all occupancy sensors and daylighting controls.

E. System Programming
1. Manufacturer shall provide system programming including:
   a. Wiring documentation.
   b. Switch operation.
   c. Telephone overrides.
   d. Operating schedules.

3.3 WARRANTY

A. The contractor shall warrant the completed lighting control system to be free from inherent mechanical and electrical defects for a period of one (1) year from the date of the completed and certified test or from the date of first beneficial use.

END OF SECTION 26 09 43

SECTION 26 24 16

POWER PANELBOARDS - CIRCUIT BREAKER TYPE

PART 1 - GENERAL

1.1 GENERAL

A. The work under this section includes but is not limited to the following:
1. Power Panelboards
2. Power Circuit Breakers

PART 2 - PRODUCTS

2.1 PANELBOARDS - GENERAL

A. Panelboards shall be dead front type, having lugs only or circuit breaker in mains as shown in panelboard schedule with circuit breaker branches.

B. Panelboard bus structure and main lugs or main breaker shall have current ratings as shown on plans. Such rating shall be established by heat rise test with Maximum hot spot temperature on any connector or bus bar not to exceed 50 degrees C rise above ambient at full rated load. Heat rise test shall be conducted in accordance with UL Standard UL67. Bus structure shall be tin-plated aluminum or tin-plated copper. All neutral busses shall be full size. All panelboards shall contain ground buss.

C. Entire panelboard assembly, including all bussing, shall have SCCR ratings meeting or exceeding the minimum AIC ratings listed on the plans for the panel. All ratings shall be full ratings. Series ratings will not be allowed unless shown otherwise on drawings.

D. Panelboards shall be listed by Underwriters Laboratories and shall bear the UL label. Panelboards shall be suitable for use as service equipment when required.

E. Top/bottom feed arrangement and lug sizes/quantities shall be coordinated by the contractor.

F. Service entrance panelboards shall be provided with barrier such that no uninsulated, ungrounded service busbar or service terminal is exposed to inadvertent contact by persons or maintenance equipment while servicing load terminations**.**

2.2 CIRCUIT BREAKERS

A. Where the highest continuous current trip setting for which the actual overcurrent device installed in a circuit breaker is rated (or can be adjusted to is 1200A or higher, breakers shall be electronic trip and shall be provided with arc energy-reducing maintenance switching (with local status indicator) to reduce arc flash energy per NEC 240.87 requirements.

B. Circuit breakers shall be quick-make and quick-break, whether actuated automatically or manually. Circuit breakers shall have inverse time tripping characteristics with automatic release which shall trip free of the handle. Circuit breaker handles shall be three distinct positions—“OFF”, “ON”, and “TRIPPED”. When a circuit breaker opens on overload or short

circuit, the operating handle shall automatically assume the "TRIPPED" position.

C. Multipole breakers shall be internal common trip with single operating handle. External handle ties are not acceptable, unless specifically noted otherwise (such as for multi-wire branch circuits described below).

D. Circuit breakers feeding multiwire branch circuits (as defined by NEC) consisting of separate single phase loads sharing a common neutral shall be provided with handle ties to simultaneously disconnect all ungrounded conductors per NEC Article 210.4(B). The necessary locations of these handle ties shall be coordinated by the contractor. Where necessary, the contractor may rearrange circuit breakers (as minimally as possible) as required to meet this requirement.

E. Circuit breakers shall be of the bolt-on type.

F. Circuit breakers shall be "FA" frame and larger.

G. All breakers shall meet the minimum RMS symmetrical interrupting capacity ratings shown on plans for the associated panel. All interrupting ratings shall be full ratings. Series ratings will not be allowed unless shown otherwise on drawings.

H. The front face of all circuit breakers shall be flush with each other. Breaker numbers shall be permanently attached to trim.

I. All branch circuit breakers shall be listed to UL489 or shall be specially-tested to be HACR listed.

2.3 CABINETS, TRIM AND WIREWAY SPACE

A. Clear space from bottom of lugs to bottom of wireway shall be not less than 6 inches for 400 amps and below, 10 inches for 600 amps, 12 inches for 800 amps and above.

B. Panelboard interiors shall be fastened to cabinets by adjustable aligning supports.

C. Panelboard assembly shall be enclosed in a steel cabinet. The rigidity and gauge of steel to be as specified in UL Standard 50 for cabinets.

D. Fronts of cabinets shall be made from a single sheet of full finished steel having the door cut out. Doors shall have flush hinges, and lock utilizing all metal construction (with all locks keyed alike). Front shall be attached to cabinets with hinged trim with piano-hinge down full length of one side to allow access to wiring without complete removal of outer trim. Front shall be provided with a metal directory and holder with clear plastic covering welded to the inside of the door. Fronts shall be code gauge full-finished steel with rust inhibiting primer and baked enamel finished in ASA #49 gray. Panelboards installed in exterior or wet locations shall have NEMA 3R enclosures.

E. Each section of multi-section panelboards shall be of matching heights and depths.

F. Panelboard enclosures shall be furnished as shown on panel schedule on plans for surface, flush or motor control center mounting.

2.4 MANUFACTURER

A. Panelboards shall be as manufactured by Square 'D', G.E., Siemens or Cutler Hammer.

PART 3 - EXECUTION

3.1 INSTALLATION

A. All panelboard dimensions and clearances shall be carefully checked and coordinated with the proper trades to insure proper mounting space and support prior to roughing in equipment. In no case shall any circuit breaker be located above 6’-7” A.F.F..

B. Wiring in panelboard gutters shall be done in a neat and workmanlike manner. Wiring shall be grouped into neat bundles and secured with approved tie wraps.

3.2 PANEL IDENTIFICATION

A. Refer to Specification Section 26 05 53.

END OF SECTION 26 24 16

SECTION 26 24 17

LIGHTING PANELBOARDS

PART 1 - GENERAL

1.1 GENERAL

A. The work under this section includes but is not limited to the following:
1. Lighting Panelboards
2. Circuit Breakers

PART 2 - PRODUCT

2.1 PANELBOARDS

A. Enclosure:
1. Panelboards shall be dead front type and shall be in accordance with Underwriter's Laboratories, Inc., standard of panelboards and enclosing cabinets and so labeled.
2. Panelboards installed in dry locations shall have enclosures fabricated from sheet steel and shall be finished in ASA #49. Panelboards installed in exterior or wet locations shall have NEMA 3R enclosures.
3. The door shall have a cylinder type lock. Lock shall be held in place by concealed screw to a captive nut, welded to inside of door. All locks shall be keyed alike.
4. A metal framed circuit directory card holder with clear plastic covering shall be factory-mounted on the inside of door.
5. Panels for 20 or more circuits, including spares and spaces, shall be 20 inches wide.
6. Panelboards enclosures shall be as shown on panel schedule on plans for surface, flush or motor control center mounting.
7. Provide hinged trim with piano-hinge down full length of one side to allow access to wiring without complete removal of outer trim.
8. Each section of multi-section panelboards shall be of matching heights and depths.

B. Bussing/Lugs:
1. Ampacity and service voltage of main buss, lugs or main breakers and branch circuit breakers shall be as shown on drawings.
2. All bussing and associated connectors shall be tin-plated aluminum or tin-plated copper.
3. All panelboards shall contain ground buss.
4. Entire panelboard shall be capable of withstanding a short circuit not less than the interrupting capacity of any breaker in the panel. When a power distribution system electrical study (including short circuit stud, etc.) is a part of the project, contractor shall further verify that all proposed equipment is properly rated (per the results of the study) prior to submitting shop drawings. Interrupting ratings shall be full ratings. Series ratings will not be allowed unless shown otherwise on drawings.
5. Buss connectors shall be for distributed phase arrangement.
6. Top/bottom feed arrangement and lug sizes/quantities shall be coordinated by the contractor.
7. Entire panelboard assembly, including all bussing, shall have SCCR ratings meeting or exceeding the minimum AIC ratings listed on the plans for the panel. When a power

distribution system electrical study (including short circuit stud, etc.) is a part of the project, contractor shall further verify that all proposed equipment is properly rated (per the results of the study) prior to submitting shop drawings. All ratings shall be full ratings. Series ratings will not be allowed unless shown otherwise on drawings.

8. Service entrance panelboards shall be provided with barrier such that no uninsulated, ungrounded service busbar or service terminal is exposed to inadvertent contact by persons or maintenance equipment while servicing load terminations

C. Breaker arrangement and numbering:
   1. Panelboards shall be factory assembled with branch breakers arranged exactly as indicated on plans.
   2. Breakers shall be numbered vertically beginning top left. Multi-section panelboards shall be numbered consecutively through all sections.
   3. Breaker numbers shall be permanently attached to trim.
   4. Main breakers shall be vertically-mounted (branch-mounted or back-fed main breakers will not be acceptable unless specifically so shown on plans).

2.2 CIRCUIT BREAKERS

A. Circuit breakers shall be quick break, quick make, thermal magnetic type, for alternating current. Breakers shall trip free for the handle and tripping shall be indicated by the handle assuming a position between OFF and ON.

B. Circuit breakers shall be of the bolt-on type.

C. Multi-pole breakers shall be internal common trip with single operating handle; external handle ties are not acceptable, unless specifically noted otherwise (such as for multi-wire branch circuits described below).

D. Circuit breakers feeding multiwire branch circuits (as defined by NEC) consisting of separate single phase loads sharing a common neutral shall be provided with multi-pole breakers or handle ties to simultaneously disconnect all ungrounded conductors per NEC Article 210.4(B). The necessary locations of these multi-pole breakers or handle ties shall be coordinated by the contractor. Where necessary, the contractor may rearrange circuit breakers (as minimally as possible) as required to meet this requirement.

E. All breakers shall meet the minimum RMS symmetrical interrupting capacity ratings shown on plans for the associated panel. All interrupting ratings shall be full ratings. Series ratings will not be allowed unless shown otherwise on drawings.

F. All branch circuit breakers shall be listed to UL489 or shall be specially-tested to be HACR listed.

2.3 SPECIAL REQUIREMENTS

A. Any special requirements on the drawings, such as for increased interrupting rating, ground fault protection, etc., shall supersede these specifications, but only insofar as that particular requirement is concerned.

B. Lighting panels larger than 400A shall conform to the requirements for power panels.

2.4 MANUFACTURER

A. Panelboards shall be as manufactured by Square 'D', G.E., Siemens or Cutler Hammer.

PART 3 - EXECUTION

3.1 INSTALLATION

A. All panelboard dimensions and clearances shall be carefully checked and coordinated with the proper trades to insure proper mounting space and support prior to roughing in equipment. In no case shall any circuit breaker be located above 6’-7” A.F.F..

B. Wiring in panelboard wireways shall be done in a neat and workmanlike manner. Wiring shall be grouped into neat bundles and secured with approved tie wraps.

C. For all flush-mounted panelboards, a minimum of three (3) one-inch empty conduits shall be stubbed out above the nearest accessible ceiling space for future use.

3.2 PANEL IDENTIFICATION

A. Refer to Specification Section 26 05 53.

END OF SECTION 26 24 17

SECTION 26 27 26

WIRING DEVICES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Wiring Devices

B. Plates

C. Finishes

PART 2 - PRODUCTS

2.1 WIRING DEVICES AND PLATES

A. Switches shall be AC type, extra-heavy duty industrial grade (unless otherwise shown) of ratings shown on drawings. Switches shall be as manufactured by Hubbell, P & S, Sierra, Bryant, GE, Arrow Hart or equal.

B. Receptacles shall have blade configuration and shall be heavy duty industrial grade (unless otherwise shown) of current and voltage rating as shown on drawings. Receptacles shall be as manufactured by Hubbell, P & S, Sierra, Bryant, GE, Arrow Hart or equal.

C. All GFCI-type receptacles shall continuously self-test and shall trip/deny power if the receptacle does not provide proper GFCI protection or if the line/load terminations are miswired and shall provide visual indication of power status, trip conditions, ground fault conditions and end-of-life status.

D. Each wiring device shall have a plate (see “Finishes” section below for specific requirements).

2.2 FINISHES

A. All wiring devices (switches, receptacles, etc.) shall be colored to match the coverplates described below. For instance, all items covered by stainless steel, aluminum or malleable iron plates shall be gray in color.
   1. Exceptions:
      a. Emergency wiring devices shall be red.
      b. Isolated ground wiring devices shall be orange.

B. Coverplates for recessed, wall-mounted electrical items (switches, receptacles, telephone outlets, etc.) shall be stainless steel unless shown otherwise.

C. Coverplates, trim rings, etc. for recessed, floor-mounted electrical items (floor outlets, underfloor duct junctions, etc.) shall match finish of building hardware (302/304 stainless steel, brass, etc.) in area installed.

D. Coverplates for exposed electrical items (switches, receptacles, telephone outlets, etc.) shall be

of same material as exposed boxes (see Outlet Box Specification for required material type) and shall have beveled edges.

E. Coverplates for receptacles in wet locations shall be metallic, in-use type, rated for wet locations per NEC requirements unless noted otherwise.

F. See “Electrical Identification” specification section for coverplate labeling requirements.

PART 3 - EXECUTION

3.1 GENERAL MOUNTING

A. Symbols on drawings and mounting heights are approximate. The exact locations and mounting heights shall be determined on the job, and it shall be the Contractor's responsibility to coordinate with all trades to secure correct installation. For example, Contractor shall coordinate exact mounting heights over counters, in or above backsplashes, in block walls, and at other specific construction features.

B. Verify all door swings with Architectural. Locate boxes for light switches within four inches of door trim on swing side (not hinge side) of door.

C. Devices and associated plates shall not be used as support; outlet boxes shall be rigidly supported from structural members.

D. Mount all straight-blade receptacles vertically with ground pole up, unless specifically noted otherwise.

E. Unless otherwise shown or required by local handicap codes, outlet boxes shall be the following distances above the finished floor unless otherwise noted.
1. Receptacles and telephone outlets in offices and other finished areas: 1’-6” to the center of the box.
2. Receptacles and telephone outlets in equipment rooms and other unfinished areas: 4’-0” to the center of the box.
3. Receptacles over counters: As Noted
4. Switches, general: 4’-0” to the top of the box.
5. Fire Alarm Pull Stations: 4’-0” to the top of the box.
6. Fire Alarm Audio/Visual Devices: As shown on fire alarm shop drawings (Entire lens shall be above 80” and below 96” per NFPA 72).
7. Push-button, etc., general: 4’-0” to the top of the box.
8. Other device types: verify with engineer prior to rough-in.

END OF SECTION 26 27 26

SECTION 26 28 16

SAFETY SWITCHES AND FUSES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Safety Switches

B. Fuses

C. Branch Feeders

D. Feeders

PART 2 - PRODUCTS

2.1 SAFETY SWITCHES

A. Safety switches shall be quick-make, quick-break, NEMA heavy duty type HD, fused or nonfused as shown. Switch blades shall be fully visible in the off position.

B. Safety switches shall be furnished with transparent internal barrier kits to prevent accidental contact with live parts. Barriers shall provide finger-safe protection when the switch door is open and shall allow use of test probes and removal of fuses without removing barrier.

C. Fused switches shall have provisions for class R, rejection type fuses.

2.2 FUSES (600V)

A. Fuses for all branch switches shall be Bussman Mfg. Co., Dual Element, Class “R” Fusetron.

B. Fuses for main switch/switches shall be Bussman Mfg. Co. Hi-Cap.

2.3 MANUFACTURER

A. Safety switches shall be as manufactured by Square 'D', G.E., Siemens or Cutler Hammer.

B. Fuses shall be as manufactured by Bussman Mfg. Co. or equal.

PART 3 - EXECUTION

3.1 SAFETY SWITCHES

A. Safety switches shall be installed as shown on the plans and in accordance with N.E.C.

B. Locations shown for safety switches on plans are diagrammatical only. Exact locations shall be field coordinated by contractor as required to provide code-required clearances.

C. Switch enclosures shall be rated NEMA I indoors in dry locations and NEMA3R outdoors and

in wet areas.

D. Adequate support shall be provided for mounting safety switches. Safety switches shall not be mounted to the associated equipment (unless the safety switch is furnished with the equipment).

3.2 FUSES

A. Fuses shall be sized as shown on drawings, unless a smaller size is required by the associated equipment supplier, in which case the contractor shall provide fuses sized as directed by the associated equipment supplier at no additional cost.

B. Provide not less than one spare set of fuses for each size used. Provide an additional spare set for each five sets of same size fuses used.

END OF SECTION 26 28 16

SECTION 26 41 00

LIGHTNING PROTECTION SYSTEM

PART 1 - GENERAL

1.1 SCOPE

A. Furnish and install all materials and labor required to provide a complete and functional Lightning Protection and Common Grounding System as indicated, in strict accordance with this section of the Specifications and the applicable Contract Drawings.

1.2 STANDARDS & QUALITY ASSURANCE

A. The lightning protection system shall comply with all requirements of the latest edition of each of the following codes and standards. The latest edition of these codes and standards form a part of this specification:
1. U.L. Standard 96A.
2. Lightning Protection Institute - Installation Code LPI-175.
3. N.F.P.A. 780.

B. Equipment manufacturer shall be certified by the Lightning Protection Institute, and products approved for UL listing. All materials shall be manufactured by one of the following manufacturers:
1. Bonded Lightning Protection Systems
2. East Coast Lightning Protection
3. Erico/Eritech Lightning Protection
4. Harger Lightning Protection
5. Preferred Lightning Protection
6. Robbins Lightning
7. Thompson Lightning Protection

C. For approval of LPI manufacturer other than specified, complete proposed material data and installation drawings shall be submitted to Engineer for review not less than 10 days prior to bid date.

D. In order to insure integrity of installation, the system shall be installed under the direct jobsite supervision of a Certified Master Installer/Designer, who has qualified under the LPI's Certification Program as a Master Installer/Designer.

1.3 SUBMITTALS

A. Complete shop drawings of the entire lightning protection system showing the type, size, mounting details, and location of all equipment, grounds, cable routings, roof materials (for coordination of lightning protection system materials), etc., shall be submitted to the Architect-Engineer for approval prior to start of work.

B. Submittals shall document the local manufacturer’s representative’s Certified Master Installer/Designer qualifications from LPI.

PART 2 - PRODUCTS

2.1 SYSTEM

A. System materials in general shall be copper, copper alloy or aluminum with high-copper content bronze castings or aluminum castings (all compatible with associated surface materials and installed per UL, NFPA & LPI standards), and shall comply in weight, size and composition for the class of structure to be protected. The system shall consist of all necessary cables, air terminals, mounting bases, fittings, couplings, connectors, fasteners, surge protection devices, etc., as required to give a complete and coordinated system.

B. Copper conductors shall be utilized for all downleads and below-grade conductors.

C. Aluminum components shall be utilized in cases where copper is not compatible with mounting surfaces.

D. All ground rods shall be copper-clad steel.

E. All cable and all air terminals shall bear proper UL labels.

F. Air terminals shall have blunt tips.

G. System design shall be concealed wherever practical, with roof perimeter cables concealed in parapet walls, and mid-roof cables installed under roof slabs. Exposed cable on parapet walls will only be accepted if structural details preclude cable concealment. Cable drops for roof penetrations at downlead locations shall be made with solid-bar thru-roof connectors, with copper rod flashings. Bond rebars top and bottom at each downlead position and risers. Primary and secondary bonding of roof metals and equipment shall also be under roof slabs. Ground level, intermediate and roof level potential equalization shall be provided per current building Code classifications.

H. All system fittings except cable holders, regardless of Structure classification, shall be heavy-duty type made from bronze or aluminum castings and secured with bolted-pressure clamps. Pressure plates made from stamped or pressed metal parts, or fittings utilizing crimp-type pressure devices will not be allowed. All bolts, screws, and related type hardware shall be stainless steel.

I. Contractor shall coordinate with the roofing contractor to insure compatibility of any adhesive with the roofing system in use.

J. Cable fasteners shall be substantial in construction, electrolytically compatible with the conductor and mounting surface, and shall be spaced according to LPI, UL, and NFPA code requirements.

K. Where applicable, an approved bimetal transition fitting shall be used at the roof level to change from aluminum roof conductor to copper downlead cable.

L. Surge protection devices shall be provided on the power, telecommunications and other conductive electrical services at the points of entrance into the building(s) as required by UL96A in order to obtain the UL Master Label Certificate of Inspection. It shall be the responsibility of the electrical contractor to install or verify that a proper surge protection device has been installed on the each of the building electrical services to meet this requirement. This

may require surge protection devices in addition to those specifically shown on plans or called out within other specifications.

PART 3 - EXECUTION

3.1 SUPERVISION AND CERTIFICATION

A. The manufacturer's local representative shall be a Certified Master Installer/Designer under the LPI program, and shall provide direct jobsite technical supervision to Contractor's personnel during installation to insure compliance with all Code requirements. Upon job completion, Contractors shall furnish Owners with written certification on UL Master Label "C",that system is installed in compliance with above Standards.

END OF SECTION 26 41 00

SECTION 26 43 00

SURGE PROTECTIVE DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes field-mounted SPDs for low-voltage (<1000 V) power distribution and control equipment.

B. The specified unit(s) shall provide effective high energy transient voltage surge suppression, surge current diversion and high frequency noise attenuation in all electrical modes for equipment connected downstream from the facility's meter or load side of the main overcurrent device. The unit(s) shall be connected in parallel with the facility's wiring system.

C. The unit(s) shall be designed and manufactured in North America by a qualified manufacturer of suppression filter system equipment. The qualified manufacturer shall have been engaged in the commercial design and manufacturer of such products for minimum of ten (10) years.

D. All products that are submitted according to these specification will be required to meet this specification in it's entirety for both service and distribution TVSS systems. Any product that is submitted and does not comply with all parts of this specification will be subject to rejection.

1.3 DEFINITIONS

A. VPR: Voltage Protection Rating.

B. SPD: Surge Protective Device(s)

C. $I_{(n)}$: Nominal Discharge Current

1.4 SUBMITTALS

A. See specification section 26 05 00.

B. Product Data: For each type of product indicated. Include:
1. Maximum Single Impulse Surge Current Rating.
2. Surge Life (Repetitive Surge) Rating.
3. UL1449 (Latest Edition) Voltage Protection Ratings (VPR).
4. UL1449 (Latest Edition) Nominal Discharge Current (In).
5. Product dimensions and weights.
6. Furnished specialties and accessories.

C. Qualification Data:

D. Safety Agency File Number.

E. ISO 9001-2008 Certification.

F. ISO 1401-2001 Certification.

G. Operation and Maintenance Data: For SPDs to include all submittal data and any applicable operation and maintenance manuals.

H. Warranties: Sample of special warranties.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a testing agency, and marked for intended location and application.

B. The unit shall be UL 1449 Listed and CUL Approved as a Surge Protective Device and UL 1283 Listed as an Electromagnetic Interference Filter

C. Provide 2nd party certified data demonstrating SPD response to ANSI/IEEE C62.41.2-2002 standard waveforms when tested according to IEEE C62.45.

D. Comply with NFPA 70.

E. All SPDs provided within this project at the service entrance, distribution panels, and sub-panels shall be from the same manufacturer.

1.6 PROJECT CONDITIONS

A. Service Conditions: Rate SPDs for continuous operation under the following conditions unless otherwise indicated:
1. Maximum Continuous Operating Voltage: Not less than 115 percent of nominal system operating voltage.
2. Operating Temperature: 30 to 150 deg F.
3. Humidity: 0 to 95 percent, non-condensing.
4. Altitude: Less than 13,000 feet above sea level.

1.7 COORDINATION

A. Where field-mounted SPD's are specifically shown on plans, coordinate locations of field-mounted SPDs to allow adequate clearances for maintenance.

1.8 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of surge suppressors that fail in materials or workmanship within specified warranty period.
1. Warranty Period: 10 years from date of Substantial Completion.

1.9 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective

covering for storage and identified with labels describing contents.

1. Replaceable Protection Modules: 1 of each size and type installed, where field-replaceable modular SPDs are provided.
2. Fuses: 1 of each size and type installed, where field-replaceable fuses are provided.

PART 2 - PRODUCTS

2.1 SURGE PROTECTIVE DEVICES

A. Manufacturer:

1. Integral Devices: Surge Protective Devices shall be as manufactured by the distribution equipment manufacturer (Square D, etc.), or by Surge Suppression Inc. if all of the performance of this specification are met and all UL listing of the equipment manufacturer are met.
2. External Devices (where specifically specified on plans): Surge Protective Devices shall be as manufactured by the distribution equipment manufacturer (Square D, etc.) or Surge Suppression Inc.

B. Each Surge Protective Device shall:

1. Be internal to the associated distribution equipment (without violating any applicable UL listings) unless specifically shown otherwise on plans.
2. Be UL 1449 (Latest Edition) listed.
3. Have short-circuit current rating complying with UL 1449 (Latest Edition), that matches or exceeds the short-circuit rating of the associated distribution equipment.
4. Be designed to withstand a maximum continuous operating voltage (MCOV) of not less than 115% of nominal RMS voltage.
5. Have fuses, rated at 200-kA interrupting capacity.
6. Have a minimum UL 1449 Nominal Discharge Current (I_n) Rating of 20kA.
7. Be fabricated using bolted compression lugs.
8. Provide suppression for all ten (10) modes of protection.
9. Have LED indicator lights for power and protection status of each phase.
10. Have audible alarm, with silencing switch, to indicate when protection has failed.
11. Have form-C contacts rated at 2 A and 24-V ac minimum, one normally open and one normally closed, for remote monitoring of protection status. Contacts shall reverse on failure of any surge diversion module or on opening of any current-limiting device. Coordinate with facility monitoring and control system if monitoring by that system is required by plans or other specifications.
12. Have six-digit transient-event counter, mounted to front of equipment door, set to totalize transient surges (externally mounted SPD's may have the transient –event counter monted on the visible face of the SPD).
13. Meet all UL 96A requirements (for Lightning Protection Systems) where the device is installed at a service entrance of the facility. At a minimum, these devices shall:
    a. Be marked as Type 1 or Type 2 SPDs with product Identity consisting of "Surge Protective Device" or "SPD", and identifying all ratings so required by UL96A and the 4 digit alpha numeric Control Number.
    b. Have a minimum UL 1449 Nominal Discharge Current (I_n) Rating of 20kA.
    c. Be UL listed and labeled with holographic label.

C. Peak Single-Impulse Surge Current Rating shall be meet the following minimums unless

specifically shown otherwise on plans:

Application	Per Phase	Per Mode
Service Entrance Devices	240 kA	120 kA
Downstream Devices	160 kA	80 kA

D. The ANSI/UL 1449 voltage protection rating (VPR) in grounded wye circuits, the SPDs shall not exceed the following:

Modes	208Y/120V	480Y/277V	600Y/347V
L-N,L-G, N-G	800	1200	1500
L-L	1200	2000	2500

E. The ANSI /UL 1449 VPR for 240/120 V, 3-wire or 4-wire circuits with high leg shall not exceed the following:

Modes	240/120V
L-N,L-G, N-G	1200/800

2.2 ENCLOSURES

A. Where external units are specifically specified on plans, units not mounted within electrical distribution equipment (such as switchboards, MCC's, etc.) shall be provided in enclosures with NEMA enclosure ratings that match or exceed the NEMA enclosure ratings of the equipment from which the units are fed. For example, a unit fed from a NEMA 4X stainless steel panelboard shall also be mounted within a NEMA 4X stainless steel enclosure.

PART 3 - EXECUTION

3.1 INSTALLATION

A. All SPD's shall be integrally-mounted within the associated distribution equipment unless specifically shown otherwise on plans.

B. Install SPDs at service entrance on load side, with ground lead bonded to service entrance ground.

C. Install SPDs downstream of the service entrance with conductors or buses between suppressor and points of attachment as short and straight as possible. The lead lengths between the TVSS unit and the equipment being protected shall not exceed fourteen (14) inches without approval from the engineer. Do not bond neutral and ground. Leads shall be as straight as possible with no sharp bends.

D. Where externally-mounted SPD's are specifically shown on plans, provide circuit breaker as

directed by the SPD supplier as a dedicated disconnecting means for SPD unless otherwise indicated.

3.2 FIELD QUALITY CONTROL

A. Ensure that interiors are free of foreign materials and dirt.

B. Check and test switches, pushbuttons, meters for proper operation.

C. Check and test indicating lights for proper operation and color.

D. Perform manufacturer's on site field test procedures.

3.3 STARTUP SERVICE

A. Do not perform insulation resistance (MEGGER) tests of the distribution wiring equipment with the SPDs installed. Disconnect all wires, including neutral, before conducting insulation resistance tests, and reconnect immediately after the testing is over.

3.4 SYSTEM WARRANTY

A. The SPD system manufacturer shall warranty the entire SPD system against defective materials and workmanship for a period of ten (10) years from the date of substantial completion. This warranty is in effect as long as the unit is installed in compliance with the manufacturer's installation, operation, and maintenance manual, UL Listing requirements, and any applicable national or local electrical codes.

B. Any SPD device which shows evidence of failure or incorrect operation, including damage as the result of lightning strikes, during the warranty period shall be replaced by the manufacturer at no charge to the owner. Warranty will provide for multiple exchanges of any inoperable devices at any time during the warranty period which starts at the date of substantial completion of the system to which the surge suppressor is installed.

C. The manufacturer is required to have a nationwide network of factory-authorized local service representatives for repair and service of this product. The manufacturer shall have a dedicated 1-800 telephone number for service problems and questions. This number shall be manned by a knowledgeable factory employee to ensure prompt response to any emergency situation that may arise.

END OF SECTION 26 43 00

SECTION 26 50 00

LIGHTING MATERIALS AND METHODS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Lighting Fixtures

B. Drivers

1.2 SUBMITTALS

A. Complete submittals shall be provided identifying all lighting fixture types and options, all lamp types (where applicable) and compliance with all contract requirements. The absence of clear submittal information specifically listing exceptions/deviations from detailed contract requirements will be understood to indicated that the contractor/supplier intends to meet all contract requirements. Refer to specification section 26 05 00 for additional requirements.

PART 2 - PRODUCTS

2.1 GENERAL

A. Lighting fixtures shall be furnished as shown on plans and specified herein. It shall specifically be the responsibility of Contractor to verify exact types ceilings, walls, etc. and recessing depth of all recessed fixtures and furnish the specific mounting trims and accessories of the specified and/or accepted fixture specifically for the ceiling, wall etc. in which each fixture is to be installed.

B. Base bid manufacturers are listed on the lighting fixture schedule. Manufacturers listed without accompanying catalog numbers are responsible for meeting the quality standards, efficiency, maximum wattages and photometric distributions set by the specified product.

C. All lighting fixtures shall be so designed and shall have drivers and other similar items so installed as to function without interruptions or failures when operating in the environment in which they are proposed to be installed. Special attention shall be given to environments with potentially high ambient temperatures such as attic spaces, exterior soffits, confined interior soffits, coves, unconditioned spaces, etc. and shall be addressed by providing fixtures with suitable high ambient temperature ratings, remote mounting of drivers/ballasts, providing approved ventilation, etc. as directed by fixture manufacturer and approved by engineer, at contractor’s expense.

D. All fixtures installed such as to create penetrations through fire rated ceiling or wall assemblies shall be labeled as suitable for that purpose or installed with covers, tenting or other means as required to maintain the fire rating of the assembly.

2.2 LED LUMINAIRES

A. For the purpose of these specifications, LED Luminaires shall be defined as the entire LED fixture assembly including LED array, drivers, housing, electronics, etc. that compose the

lighting fixture.

B. Furnish and install LED Luminaire of proper size, type, efficacy, delivered lumen output, color temperature, distribution pattern, operational life, and CRI as shown on drawings.

C. LED Luminaires shall be tested in accordance with LM-79 and LM-80 standards.

D. LED drivers shall comply with NEMA 410 standards for inrush current, etc.

E. Exterior, pole mounted LED Luminaires shall be provided with an easily-serviceable, UL recognized surge protection device that meets a minimum 10kA Category C Low operation (IECC C62.41.2-2002). Device shall be wired in front of light engine(s) and driver(s) and shall fail "open" such as to prevent fixture operation after a surge protection failure.

F. LED Luminaires shall have a guarantee-warranty of at least five years unless specifically noted otherwise on contract documents.

G. LED Luminaire assembly shall comply with ambient temperature requirements specified in General section above.

2.3 STEMS/PENDANTS

A. Hangers shall be approved ball aligner type swivel, 30 degrees from vertical with swivel below canopy.

B. Stems/Pendants shall be rigid or IMC conduit unless specified otherwise on plans. Proposed stem/pendant types shall be submitted for review prior to shipment of light fixtures from factory.

C. Stems/Pendants shall be provided as required to prevent swaying of fixtures due to HVAC system airflow or other similar occurrences.

D. Shall be painted the same color as the fixture trim unless noted otherwise.

2.4 MANUFACTURER

A. Fixtures and stems shall be manufactured as shown in fixture schedule or approved equals.

B. Drivers shall be as manufactured by Philips/Advance, GE, Lutron, Magnatec, Motorola, EldoLED or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION OF LIGHTING FIXTURES

A. Support:
1. Support of all lighting fixtures shall be responsibility of electrical contractor. All lighting fixture supports shall be installed in accordance with lighting fixture supplier's recommendations.
2. Contractor shall coordinate installation requirements for all wall-mounted fixtures (especially for wall-mounted fixtures on uneven wall surfaces, etc.) as required to assure a

level/flat mounting surface and level/plumb/secure finished installation. Contractor shall provide flat mounting plates or other mounting provisions where necessary. Any proposed mounting plates, etc. shall be submitted to and approved by project architect prior to ordering materials.

3. Fixtures shall be supported independent of ceiling from structural members of building.
4. Lay-in fixtures shall be supported by four (4) taut 12 gauge hanger wires connected from each corner of the fixture to the structure above so that fixture is supported independent of the ceiling.
5. Other recessed light fixtures (including recessed downlights) shall be supported with two (2) taut 12 gauge hanger wires connected from opposing corners of the light fixture to the structure above so that fixture is supported independent of the ceiling.
6. Pendant mounted fixtures shall be directly supported from the structure above using a 9 gauge hanger wire or an approved alternate support without using the ceiling suspension system for direct support.
7. Tandem fixtures may utilize common hanger wires.
8. All lay-in fixtures shall be attached to ceiling grid by means of approved clips and in accordance with the N.E.C.
9. Contractor shall submit typical hanging detail to Engineer before installing any fixtures.

B. Connections:
1. All grid fixtures shall be wired by flex individually to junction and not wired fixture to fixture.
2. All flex shall contain 3 conductors (3rd wire ground). Ground wire shall be securely grounded at each end. Other conductors shall be connected by approved connectors.

C. Row-Mounted fixtures:
1. All stems on row-mounted fluorescent fixtures shall be installed as follows (except fixtures with slide grip hangers):
   a. One stem shall be installed in the first fixture knockout from end of row (on the first and last fixture of the row).
   b. One stem shall be installed between each two fixtures. Stem shall center joint where fixtures join and shall attach by use of “joining plates”.
2. All fixtures in continuous rows other than recessed grid type shall be connected by nipples with locknuts bushings.

D. Coordination:
1. Contractor shall coordinate all dimensions & locations of light fixtures prior to rough-in to insure proper fit and coordination with other trades.
2. Contractor shall verify exact ceiling types being installed and shall adjust fixture trim types accordingly (prior to submitting light fixture shop drawings).

END OF SECTION 26 50 00

SECTION 27 05 00

AUXILIARY SYSTEM CABLES, 0-50V

PART 1 - GENERAL

1.1 DESCRIPTION

A. Cables rated for 0V-50V application

PART 2 - PRODUCTS

2.1 GENERAL

A. Unless specified otherwise, all cables within the scope of this specification section shall:
1. Be rated for exposed cable tray installation.
2. Be plenum rated.
3. Be UL-rated for the proposed application.
4. Be multi-conductor with overall outer sheath as required by the application. The insulation of each conductor within the overall multi-conductor cable shall be uniquely color-coded. Ground conductors (when provided) within the multi-conductor cable shall have green insulation. Conductors with green insulation shall not be used for conductors other than ground.
5. Utilize copper conductors.
6. Have wire gauge as required to limit voltage drop to acceptable limits determined by the system supplier and to meet all applicable code requirements.
7. Where installed underground, within slab-on-grade or in exterior locations, be rated for wet locations.
8. Where required for specific systems, meet the specific requirements (conductor quantity, wire gauge, insulation type, shielding, etc.) of the system supplier.

2.2 CLASS 1 CONTROL CABLING (120VAC CONTROL CIRCUITS, ETC.)

A. In addition to above requirements, and unless specified otherwise, Class 1 control cabling shall:
1. Be rated for 600V.
2. Be industrial grade.
3. Have stranded conductors.
4. Have sunlight/oil-resistant PVC/Nylon insulation and jacket with ripcord.
5. Be manufactured by Belden, AlphaWire or General Cable.

2.3 CLASS 2 & 3 CONTROL CABLING (FED FROM CLASS 2 OR 3 POWER SUPPLIES)

A. In addition to above requirements, and unless specified otherwise, Class 2 & 3 control cabling shall:
1. Be rated for 300V.
2. Be shielded if so recommended by the system supplier/integrator.
3. Have twisted conductors.
4. Have plenum-rated insulation/jacket with ripcord.
5. Be manufactured by AlphaWire, Belden, General Cable, Superior Essex or West Penn.

2.4 NETWORK CABLING

A. Furnish and install all Ethernet, Fiber Optic and Backbone Copper Telephone cabling in accordance with all BICSI requirements and in accordance with other applicable specification sections.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION

A. Routing:
1. All wires and cables shall be installed in conduit unless specifically noted otherwise. Where conduit is not otherwise required by contract documents, 0-50V Cabling located within concealed, accessible ceiling spaces (such as above lay-in ceilings) may be run without conduit if the following requirements are met:
   a. Cabling is plenum-rated, multi-conductor.
   b. Cabling is supported by cable tray or with J-hook supports on intervals not to exceed 5'-0" on center. Cabling shall be supported solely from the cable tray or j-hooks supported from the building structure, without using piping, ductwork, conduit or other items as supports.
   c. Cabling is neatly formed, bundled and tied with plenum-rated Velcro straps on intervals not to exceed 30" on center.
   d. Properly-sized conduit(s) are provided wherever cabling enters an inaccessible or exposed area (such as above gyp board ceilings, within walls or through walls).
   e. Cabling is not a part of a Fire Alarm System, Smoke Control System, Emergency Generator Control System or other life-safety related system.
2. End bushings shall be provided on both ends of all raceway terminations.
3. No splices shall be pulled into conduit.
4. No cabling shall be pulled until conduit is cleaned of all foreign matter.

B. Penetrations:
1. All fire/smoke barrier penetrations shall be made in accordance with a U.L. listed assembly.
2. For cabling not installed in conduit:
   a. Fire/smoke barrier penetrations shall be sealed utilizing an enclosed fire-rated pathway device (STI EZ Path or equal) containing a built-in fire sealing system sufficient to maintain the hourly fire rating of the barrier being penetrated. The self-contained sealing system shall automatically adjust to the installed cable loading and shall permit cables to be installed, removed or retrofitted without the need to remove or reinstall firestop materials. The pathway shall be UL Classified and tested to the requirements of applicable ASTM/UL1479 standards.
3. For cabling installed within conduit from endpoint to endpoint:
   a. Fire/smoke barrier penetrations shall sealed utilizing fire caulk or other equivalent firestop systems around perimeters of conduits per UL requirements.
4. For cabling installed within cable trays:
   a. Fire/smoke barrier penetrations shall be sealed with one of the following methods:
      1) Continuous cable tray through the penetration, with a combination of large firestop pillows and small firestop pillows contained, supported and secured (to prevent unauthorized removal) on both sides by aluminum wire mesh and firestop putty. Firestop pillows shall be STI Series SSB or equal and Firestop putty shall be STI Spec Seal or equal.

2) Cable tray broken at the penetration, with fire/smoke barrier penetrations sealed utilizing an enclosed fire-rated pathway device (STI EZ Path or equal) containing a built-in fire sealing system sufficient to maintain the hourly fire rating of the barrier being penetrated. The self-contained sealing system shall automatically adjust to the installed cable loading and shall permit cables to be installed, removed or retrofitted without the need to remove or reinstall firestop materials. The pathway shall be UL Classified and tested to the requirements of applicable ASTM/UL1479 standards.

C. Excess Cabling:
1. Excess cabling shall be neatly coiled within all junction boxes, pullboxes, wireways, etc. and at all terminations as required to allow future re-termination of cabling.

D. Terminations:
1. All conductors/cabling (including spare conductors) shall be properly terminated unless specifically directed otherwise. See below for general termination hardware requirements.
2. Cabling shall be neatly formed, bundled and tied at all terminations.

3.2 SPLICES/CONNECTIONS/TERMINATIONS:

A. Network Cabling:
1. Network and fiber optic cabling shall be continuous from endpoint to endpoint and shall not be spliced unless specifically noted otherwise.

B. Control Cabling:
1. Connections shall be made with T & B Sta-Kon wire joints EPT66M, complete with insulating caps. To be installed with WT161 Tool or C nest of WT11M Tool, Ideal Super - Nuts (not wire nuts), Ideal Wing Nuts, or Buchanan Elec. Products B Cap or Series 2000 Pressure connectors complete with nylon snap on insulators to be installed with C24 pressure tool.

C. Shielded cabling:
1. Unless directed otherwise by the system supplier, 0-50V cable shielding shall be grounded at the PLC/control panel end only (not at the field device end) with a termination kit as directed by the PLC/control panel supplier.
2. Shielded cabling shall be continuous from endpoint to endpoint and shall not be spliced without prior written approval from the Engineer.

3.3 LABELING

A. Refer to Specification Section 26 05 53 for all labeling requirements.

END OF SECTION 27 05 00

SECTION 27 10 00

STRUCTURED CABLING SYSTEM

PART 1 - GENERAL

1.1 SCOPE:

A. This document describes the products and execution requirements relating to furnishing and installing Telecommunications Cabling. Backbone and Horizontal cabling comprised of copper and fiber cabling, and support systems are covered under this document.

B. All cables and related terminations, support and grounding hardware shall be furnished, installed, wired, tested, labeled, and documented by the structured cabling contractor as detailed in this document.

C. Product specifications, general design considerations, and installation guidelines are provided in this document. Quantities of telecommunications outlets, typical installation details, cable routing and outlet types are indicated on the plans. If the bid documents are in conflict, this specification shall take precedence.

D. Refer to Specification Section 26 05 53 (Electrical Identification) for additional identification requirements.

E. Refer to Specification Section 27 05 00 (Auxiliary System Cables, 0-50V) for additional material and installation requirements.

1.2 REGULATORY REFERENCES:

A. All work and materials shall conform in every detail to the rules and requirements of the National Fire Protection Association, the National Electrical Code, local ordinances and present manufacturing standards.

B. All materials shall be UL Listed and shall be marked as such. If UL has no published standards for a particular item, then other national independent testing standards shall apply and such items shall bear those labels. Where UL has an applicable system listing and label, the entire system shall be so labeled.

C. All modular jacks, patch cords, consolidation point, and patch cords shall be ETL Verified (not just tested) to be category 6 component and channel compliant.

D. The cabling system described in this specification is derived from the recommendations made in recognized telecommunications industry standards. The following documents are incorporated by reference:
1. ANSI/TIA/EIA - 568-B.1, Commercial Building Telecommunications Cabling Standard Part 1: General Requirements, April, 2001
2. ANSI/TIA/EIA - 568-B.2, Commercial Building Telecommunications Cabling Standard Part 2: Balanced Twisted-Pair Cabling Components, April, 2001

3. ANSI/TIA/EIA - 568-B.2-1, Commercial Building Telecommunications Cabling Standard Part 2: Balanced Twisted Pair Cabling Components, Addendum 1 – Transmission Performance Specifications for 4-pair 100 Ω Category 6 Cabling
4. ANSI/TIA/EIA - 568-B.3, Commercial Building Telecommunications Cabling Standard Part 3: Optical Fiber Cabling Components, March, 2000
5. ANSI/TIA/EIA – 569-A, Commercial Building Standard for Telecommunications Pathways and Spaces, February, 1998
6. ANSI/TIA/EIA – 606-A, Administration Standard for Telecommunications Infrastructure of Commercial Buildings, February, 2002
7. ANSI/TIA/EIA – 607-AJ, Commercial Building Grounding and Bonding Requirements for Telecommunications, August 1994
8. ANSI/ TIA/EIA – 758, Customer-Owned Outside Plant Telecommunications Cabling Standard, April 1999
9. BICSI - TDMM, Building Industries Consulting Services International, Telecommunications Distribution Methods Manual (TDMM) 10TH edition.
10. National Fire Protection Agency (NFPA – 70), National Electrical Code (NEC) –2002
11. ANSI/TIA/EIA – 45-B, Test Procedures for Fiber Optic Connections.
12. ANSI/TIA/EIA – 526-14, Power Test for Fiber Runs.
13. FCC 47 CFR 68
14. NEMA 250
15. NEC Articles 770 and 800
16. ADA, Americans with Disabilities Act

E. If this document and any of the documents listed above are in conflict, then the more stringent requirement shall apply. All documents listed are believed to be the most current releases of the documents. The Contractor has the responsibility to determine and adhere to the most recent release.

F. This document does not replace any code, either partially or wholly. The contractor must be aware of local codes that may impact this project. All local State and federal codes are to be followed.

1.3 APPROVED CONTRACTOR:

A. The Structured Cabling Contractor must meet the following requirements:
1. Contractor must have a certified RCDD on staff. The project manager for this project shall have an RCDD certification, and RCDD shall be responsible for reviewing all aspects of the design, submittals and installation of all products.
2. All required submittal information shall be stamped by the RCDD.
3. Contractor must have a minimum of 3 years experience with projects of similar size and scope to this project.
4. The company performing the work must have been in business for a minimum of 3 years.
5. The company must have an office within 75 miles of the job site.

B. The Structured cabling contractor is responsible for workmanship and installation practices in accordance with the requirements of the standards described in these specifications and manufacturer's requirements.

1.4 WORK INCLUDED:

A. The work included under this specification consists of furnishing all labor, equipment, materials, and supplies and performing all operations necessary to complete the installation of this structured cabling system in compliance with the specifications and drawings. The structured cabling contractor will provide and install all of the required material to form a complete system whether specifically addressed in the technical specifications or not.

B. The work shall include, but not be limited to the following:
1. Furnish and install a complete telecommunications wiring infrastructure.
2. Furnish, install, and terminate all UTP and Optical Fiber cable
3. Furnish and install all wall plates, jacks, patch panels, and patch cords at equipment racks and at work outlets (unless shown otherwise on plans).
4. Furnish and install all required cabinets and/or racks as required and as indicated.
5. Furnish any other material required to form a complete system.
6. Perform channel testing (100% of horizontal and/or backbone links/channels) and certification of all components.
7. Furnish test results of all cabling to the owner on disk and paper format, listed by each closet, then by workstation ID.
8. Provide owner test results and documentation. (Testing documentation and As-built drawings)

1.5 SUBMITTALS:

A. Within thirty (30) days of notice to proceed the structured cabling contractor shall submit the following items:
1. Submit copies of the certification of the company and names of staff that will be performing the installation and termination of the installation to provide proof of compliance of this spec.
2. Submit proof from manufacturer of contractor's good standing in manufacturer's certification program.
3. Submit copy of contractor's RCDD certification.
4. Submit listing of five (5) projects of similar size and scope to this project that have been completed within the last five years. Include in this submittal owner's contact information for each project.
5. Submit letter from the manufacturer stating that the manufacturer will provide a twenty-five year (25) warranty in accordance with the requirements paragraph 1.03 (B) of these specifications.
6. Submit appropriate cut sheets and samples for all products, hardware and cabling.
7. Submit 1/8" = 1'-0" drawings of floor plans indicating all work outlets and the labeling designation for each jack.
8. Submit ½" = 1'-0" drawings of each MDF and each IDF showing all racks, patch panels, 110 blocks, etc.

B. Work shall not proceed without the engineer's approval of the submitted items.

C. The structured cabling contractor shall receive approval from the engineer on all substitutions of material. No substituted materials shall be installed except by written approval from the engineer.

1.6 DRAWINGS:

A. It shall be understood that the electrical details and drawings provided with the specification package are diagrammatic. They are included to show the intent of the specifications and to aid the structured cabling contractor in bidding the job. The structured cabling contractor shall make allowance in the bid proposal to cover whatever work is required to comply with the intent of the plans and specifications.

B. The structured cabling contractor shall verify all dimensions at the site and be responsible for their accuracy.

PART 2 - PRODUCTS

2.1 EQUIVALENT PRODUCTS:

A. Due to the nature and type of communications all products, including but not limited to faceplates, jacks, patch panels, racks, 110 blocks, and patch cords, for the purpose of this document, shall be manufactured by Hubbell, Ortronix, Panduit, Amp or Systimax. See below for acceptable cable manufacturers.

2.2 WORK AREA OUTLETS:

A. Work area cables shall each be terminated at their designated work area location in the connector types described in the subsections below. Included are modular telecommunication jacks. These connector assemblies shall snap into a faceplate.

B. The Telecommunications Outlet Assembly shall accommodate:
1. A minimum of two (2) modular jacks
2. Additional accommodations for specific locations as noted in the plans for optical fiber and/or additional copper cables as necessary
3. A blank filler will be installed when extra ports are not used.
4. A dust cap shall be provided on all modular jacks with the circuit number on the identifier strip.
5. Multiple jacks will be placed as documented on the plans.
6. The same orientation and positioning of jacks and connectors shall be utilized throughout the installation. Prior to installation, the structured cabling contractor shall submit the proposed configuration for each outlet assembly for review by the architect.
7. The modular jack shall incorporate printed label strip on the dust cap module for identifying the outlet. Printed labels shall be permanent and compliant with ANSI/TIA/EIA-606-A standard specifications. Labels shall be printed using a printer such as a Brady hand held printer. Hand printed labels shall not be accepted.

C. Faceplates: The faceplates shall:
1. be UL listed and CSA certified.
2. be constructed of stainless steel (except where noted otherwise). All faceplate colors/materials in public areas shall be approved by the architect. In all cases the material and color of the faceplate shall match the adjacent electrical faceplate.
3. (where plastic faceplates are specifically allowed by the architect/engineer) shall match the faceplate color used for other utilities in the building or match the color of the raceway if installed in surface raceway.
4. be compliant with the above requirements along with the following when incorporating optical fiber:

a. be a low profile assembly,
b. incorporate a mechanism for storage of cable and fiber slack needed for termination,
c. position the fiber optic couplings to face downward or at a downward angle to prevent contamination and,
d. incorporate a shroud that protects the optical couplings from impact damage.

5. be available as single-gang or dual-gang.
6. possess recessed designation windows to facilitate labeling and identification.
7. shall include a clear plastic cover to protect labels in the designation window.
8. have mounting screws located under recessed designation windows.
9. comply with ANSI/TIA/EIA–606-A work area labeling standard.
10. allow for the UTP modules to be inverted in place for termination purposes.
11. be manufactured by an ISO 9001 registered company.

D. Voice / Data Jacks

1. Voice/Data jacks shall be 8-position modular jacks and shall be Category 6 performance as defined by the references in this document including ANSI/TIA/EIA-568-B.2-1. All pair combinations must be considered, with the worst-case measurement being the basis for compliance. Modular jack performance shall be third-party verified by a nationally recognized independent testing laboratory including, but not limited to, ETL.
2. The wiring scheme shall be T568A or T568B as directed by the owner.
3. The modular jack shall use dual reactance modular contact array.
4. The modular jack shall have low emission IDC contacts.
5. The modular jack shall use standard termination practice using 110 impact tool
6. The modular jack shall be backwards compatible to Category 3 and 5.
7. The modular jack shall be center tuned to category 6 test specifications.
8. Dust cover shall be used on each termination.

2.3 110 COPPER TERMINATION BLOCK:

A. The voice cross connect shall be a passive connection between the horizontal termination blocks and the backbone termination blocks. The wall mount frames shall be field terminated kits including all blocks, connecting blocks, and designation strips. Management rings shall be mounted between vertical columns of blocks to provide management of cross-connect wire. Backbone and horizontal blocks shall use 4-pair connecting blocks. Blocks shall be oriented so that backbone terminations are located on the left and horizontal frames are located on the right of the termination field when facing the frame assembly.

B. 110 Block Kits shall

1. include both the wiring block and connecting block in a 50, 100 and 300 pair footprint as required
2. be manufactured using fire retardant molded plastic.
3. include 4-pair 110C connecting blocks for field termination.
4. support termination of 22-24 AWG solid conductor
5. wiring blocks shall contain back openings for the feed through of cable
6. meet category 6 component compliance and be verified by a third-party nationally recognized independent testing laboratory
7. have color-coded tips on the wiring block and color coding on the connector blocks for installation identification.
8. shall use standard termination practice requiring a single conductor 110 impact tool

9. Termination hardware shall maintain the paired construction of the cable to facilitate minimum untwisting of the wires.
10. be backwards compatible to category 3 and 5.
11. be labeled in compliance with ANSI/TIA/EIA-606-A labeling specifications using permanent labels and label printer.
12. be manufactured by an ISO 9001 registered company.

2.4 MODULAR PATCH PANELS:

A. The Modular Patch Panels shall
1. be modular design.
2. meet category 6 component compliance and be verified by a third-party nationally recognized independent testing laboratory
3. use low emission IDC contacts
4. use dual reactance technology to enhance the signal-to-noise ratio
5. require standard termination practices using a 110 impact tool
6. use a single piece IDC housing designed to accept larger Category 6 conductors
7. support both T568B and T568A wiring
8. include easy to follow wiring labels
9. include label fields
10. allow for the use of icons
11. include full length metal rear cable management
12. be available in standard or high density
13. be backward compatible to category 3 and 5.
14. be center tuned to category 6 test specifications
15. be sized to accommodate number of data or data and phone cables (where phone cables are terminated on patch panels in lieu of 110 blocks) served by each equipment room plus 30% spare capacity.
16. be separated by horizontal cable management sections.

2.5 RACKS:

A. The equipment rack shall provide vertical cable management and support for the patch cords at the front of the rack and wire management, support, and protection for the horizontal cables inside the legs of the rack.

B. Waterfall cable management shall be provided at the top of the rack for patch cords and for horizontal cables entering the rack channels for protection and to maintain proper bend radius and cable support. Double-sided wire management shall also be mounted above each patch panel and/or piece of equipment on the rack. The rack shall include mounting brackets for cable tray ladder rack to mount to the top of the rack. Velcro cable ties shall be provided inside the rack channels to support the horizontal cable. Rack shall be black in color to match the patch panels and cable management.

C. Free-Standing Racks shall:
1. have the necessary strain relief, bend radius and cable routing for proper installation of high performance cross connect products, meeting all specifications of ANSI/TIA/EIA-568-B.
2. have top cable trough with waterfall and built in patch/horizontal cable distribution separator.

3. have horizontal front and rear cable management above, below and between each 48-port patch panel.
4. have a rack-mounted power strip.
5. have EIA hole pattern on front and rear.
6. be available with a 6.0" channel depth.
7. be available with hook and loop straps for securing bulk cables inside the vertical U-channels.
8. assemble as 19" (483 mm) or 23" (584 mm) with no additional hardware.
9. be available with three styles of vertical patch cord management: interbay with latches, cable management rings, or fingerduct with covers.
10. provide floor and ceiling access for cable management and distribution.
11. provide pre-drilled base for floor attachment of rack.
12. be available in standard color of black.
13. be manufactured by an ISO 9001 registered company.

D. Wall-Mounted Racks shall:
1. provide the necessary strain relief, bend radius and cable routing for proper installation of high performance cross connect products, meeting all specifications of ANSI/TIA/EIA-568-B.
2. have top cable trough with waterfall and built in patch/horizontal cable distribution separator.
3. have horizontal front and rear cable management above, below and between each 48-port patch panel.
4. have a rack-mounted power strip.
5. have EIA hole pattern on front and rear.
6. be available with a 6.0" channel depth.
7. be available with hook and loop straps for securing bulk cables inside the vertical U-channels.
8. assemble as 19" (483 mm) or 23" (584 mm) with no additional hardware.
9. provide usable depth as required for standard network ethernet switch and other equipment
10. be available with three styles of vertical patch cord management: interbay with latches, cable management rings, or fingerduct with covers.
11. provide floor and ceiling access for cable management and distribution.
12. provide pre-drilled base for wall attachment of rack.
13. be available in standard color of black.
14. be manufactured by an ISO 9001 registered company.
15. be constructed to swing-out from wall (for rear access) via heavy-duty hinged corner and configurable for either left or right opening.

2.6 HORIZONTAL DISTRIBUTION CABLE:

A. Horizontal Distribution Cabling shall meet the following requirements:
1. Shall be 100 Ohm Enhanced Category 6 Unshielded Twisted Pair (UTP) Cable.
2. Physical Characteristics:
   a. Unless directed otherwise by owner (contractor shall verify with owner), Cat6 cable coloring shall be based on system type as follows, unless specifically approved otherwise:
      1) Data (or IP Voice): Blue
      2) Analog Voice: Grey
      3) Lighting Control System: White

4) Fire Alarm or other Life-Safety System: Red
5) CCTV Surveillance Cameras: Yellow
6) Other: As directed by owner

b. Shall be plenum-rated.
c. Shall meet applicable requirements of ANSI/ICEA S-80-576.
d. The diameter of the insulated conductor shall be .023 in. maximum.
e. Shall consist of (4) 22-26 AWG twisted pairs.
f. The overall diameter of the cable shall be no larger than 0.240 inches.
g. The ultimate breaking strength measured in accordance with ASTM D 4565 shall be 400 N minimum.
h. Cable shall withstand a bend radius of 1 inch at -20 degrees Celsius without jacket or insulation cracking.
i. Cable shall be third party verified to meet ANSI/TIA/EIA-568-B.2-1.
j. Where installed underground, within slab-on-grade or in exterior locations, be gel-filled and rated for wet locations.

3. Transmission Characteristics:
   a. DC resistance of any conductor shall not exceed 9.38 Ohms per 100m max. at 20° C. Measured in accordance with ASTM D 4566.
   b. The mutual capacitance of any pair at 1 kHz for 100m of cable shall not exceed 4.4 nF nominal.
   c. DC resistance unbalance any two conductors of any pair shall not exceed 5% when measured at or corrected to 20° C in accordance with ASTM D 4566.
   d. Structural return loss swept measurement for 100m or longer shall meet or exceed Category 6 requirements.
4. Shall be manufactured by Amp NetConnect, Berk-Tek, Leviton, General Cable, Mohawk or Superior Essex.

2.7 BACKBONE - FIBER:

A. Backbone Fiber Optic Cabling shall meet the following requirements:
   1. All optical fiber shall be Indoor/Outdoor,Tight-Buffered, All-Dielectric, Plenum rated (unless specified otherwise on plans) with Enhanced Multimode OM4-rated 50/125 Optical Fibers.
   2. Each Multimode Fiber shall:
      a. Be graded-index optical fiber wave-guide with nominal 50/125µm-core/cladding diameter.
      b. Comply with ANSI/EIA/TIA-492AAAC-A
      c. Have attenuation measured in accordance with ANSI/EIA/TIA-455-46, 53 or 61.
      d. Have information transmission capacity measured in accordance with ANSI/EIA/TIA-455-51 or 30.
      e. Have measurements performed at 23 degrees C +/- 5 degrees.
      f. Have Maximum attenuation dB/Km @ 850/1300 nm: 3.5/1.0
      g. Have bandwidth ≥ 4700 MHz-km @ 850nm. (EMB)
      h. Have bandwidth ≥ 500 MHz-km @ 1300nm.
      i. Be laser optimized and guarantee a 1 Gb/s distance of 1000 meters @ 850nm and 10 Gb/s at 600 meters @ 850nm.
      j. Terminate on fiber patch panel using SC Type fiber connectors.
   3. Each indoor/outdoor fiber optic cable shall:
      a. Be suitable for use in both outdoor and indoor applications without the use of a transition at the building entrance.
      b. Be suitable for use in risers, plenums and horizontal applications.

c. Have a dry water blocking system for cable.
d. Have a fiber strand count of 12 (unless shown otherwise on plans).
e. Have a nominal 2.21 mm sub-unit diameter.
f. Have and be marked with an UL-OFNP Flame Rating (unless engineer specified otherwise on plans).
g. Comply with Bellcore GR-409 and GR20
h. Be independently verified to comply with ICEA S-104-696
i. Have strength members of FGE/Aramid yarn.
j. Be suitable for underground or above ground conduits.
k. (Where applicable) Have Tight Buffered fibers color coded in accordance with EIA / TIA 598 with an overall black jacket.
l. Be suitable for operation between -40° to +70° C
m. Be UV resistant
n. Be of an all dielectric design

4. Shall be manufactured by Berk-Tek, Corning, General Cable or Superior Essex.

2.8 BACKBONE - COPPER:

A. Backbone Copper Cabling shall meet the following requirements:
1. Shall be Cat 3 rated.
2. Shall be RDUP PE-39 rated.
3. Where installed underground or in wet locations, shall include fully-flooded waterblocking compound to provide wet-location rating of cable.
4. Size of the backbone cables shall be determined by multiplying the number of horizontal voice cables to be terminated in each IDF by 200% and rounding up to the nearest 50 pair group. For Example if 94 horizontal voice cables are to be terminated in IDF1, install 94 x 1 pr x 200% = 188 pr rounded up to nearest 50 pr = 200 pr cable to IDF1.
5. Shall be manufactured by Berk-Tek, Corning, General Cable, Mohawk or Superior Essex.

2.9 COPPER CABLE SURGE PROTECTION DEVICES:

A. All copper circuits routed between or outside of buildings shall be provided with a surge protection device at each end. The surge protection device shall be labeled as meeting the requirements of the latest edition of UL 96A (exact requirements shall be coordinated with the lightning protection system supplier, where applicable).

B. The surge protection device shall be connected with a #6 AWG copper bonding conductor between the protector ground lug and the TC ground point.

2.10 PATCH CORDS:

A. The structured cabling contractor shall provide factory terminated and tested UTP and optical fiber patch cords and equipment cords for the complete cabling system. Patch cords shall be provided by the structured cabling contractor to connect patch panels to owner furnished electronics. The UTP patch cables shall meet the requirements of ANSI/TIA/EIA-568-B.2 and ANSI/TIA/EIA-568-B.2-1 for patch cord testing. Provide one set of optical fiber patch cables per fiber run that terminates on fiber patch panel and provide one category 6 patch cord for each category 6 work outlet that terminates on patch panel.

B. Copper (UTP) patch cords shall:
1. Be furnished to connect each patch panel jack to owner supplied electronics.

2. Be furnished for each work outlet jack.
3. Be a Category 6 patch cord manufactured by Panduit, Amp or Systimax.
4. Use 8 position connector with impedance matched contacts and designed using dual reactance.
5. Be constructed of 100 ohm, 4 pair, 24 AWG, stranded conductor, unshielded twisted pair copper per the requirements of the ANSI/TIA/EIA-568-B.2 and ANSI/TIA/EIA-568-B.2–1 standard.
6. Meet TIA category 6 component specifications in ANSI/TIA/EIA-568-B.2-1 100% factory tested to meet category 6 performance and ETL or any other nationally recognized 3rd party verification
7. Be capable of universal T568A or T568B wiring schemes.
8. Have modular connector that shall maintain the paired construction of the cable to facilitate minimum untwisting of the wires.
9. Have a performance marking indelibly labeled on the jacket (by the manufacturer).
10. Have the ability to accept color-coded labels and icons to comply with ANSI/TIA/EIA-606-A labeling specifications.
11. Have "snagless" protection for the locking tab to prevent snagging and to protect locking tab in tight locations and provide bend relief
12. Be available in three standard colors
13. Be available in 3 foot, 5 foot, 7 foot, 10 foot, and 14 foot standard lengths
14. Be backwards compatible to Category 3, 5 and 5e

C. Fiber Optic patch cords shall:
1. Be furnished in the quantity of two (2) per IDF in each IDF and two (2) per IDF in each MDF.
2. Be manufactured by Panduit, Amp or Systimax.
3. Be multimode OM4 type.
4. Have connector type as directed by owner.
5. Have a performance marking indelibly labeled on the jacket (by the manufacturer).
6. Have the ability to accept color-coded labels and icons to comply with ANSI/TIA/EIA-606-A labeling specifications.
7. Be available in three standard colors
8. Be available in 3 foot, 5 foot, 7 foot, 10 foot, and 14 foot standard lengths

2.11 GROUNDING AND BONDING:

A. The facility shall be equipped with a Telecommunications Bonding Backbone (TBB). This backbone shall be used to ground all telecommunications cable shields, equipment, racks, cabinets, raceways, and other associated hardware that has the potential to act as a current carrying conductor. The TBB shall be installed independent of the building's electrical and building ground and shall be designed in accordance with the recommendations contained in the ANSI/TIA/EIA-607 Telecommunications Bonding and Grounding Standard.

B. The main entrance facility/equipment room in each building shall be equipped with a telecommunications main grounding bus bar (TMGB). Each telecommunications room shall be provided with a telecommunications ground bus bar (TGB). Each grounding bus shall be 12"W x 4"H x ¼"THK and be mounted to the backboard with porcelain isolators.

C. All wires used for telecommunications grounding purposes shall be identified with a green insulation. Non-insulated wires shall be identified at each termination point with a wrap of

green tape. All cables and bus bars shall be identified and labeled in accordance with the System Documentation Section of this specification.

2.12 FIRESTOP:

A. A firestop system is comprised of the item or items penetrating the fire rated structure, the opening in the structure and the materials and assembly of the materials used to seal the penetrated structure. Firestop systems comprise an effective block for fire, smoke, heat, vapor and pressurized water stream.

B. All penetrations through fire-rated building structures (walls and floors) shall be sealed with an UL listed firestop system. This requirement applies to through penetrations (complete penetration) and membrane penetrations (through one side of a hollow fire rated structure). Any penetrating item i.e., riser slots and sleeves, cables, conduit, cable tray, and raceways, etc. shall be properly firestopped.

2.13 INNERDUCT:

A. Innerduct, shall be:
1. Non-metallic, corrugated with pre-installed pull tape.
2. Plenum-rated, where installed within buildings.
3. UL listed for the application.
4. Size as required by the application.
5. Orange in color in concealed areas or within telecommunications or electrical rooms. Color shall be custom as selected by owner in exposed areas (such as within cable trays overhead in areas without ceilings outside telecommunications/electrical rooms).

PART 3 - EXECUTION

3.1 PRE-INSTALLATION SITE SURVEY:

A. Prior to start of work, meet at the project site with the owner's representative and representatives of trades performing related work to coordinate efforts. Review areas of potential interference and resolve conflicts before proceeding with the work. Facilitation with the General Contractor will be necessary to plan the crucial schedule completions of the equipment rooms and telecommunication closets.

B. Examine areas and conditions under which the system is to be installed. Do not proceed with work until satisfactory conditions have been achieved.

3.2 WORK AREA OUTLETS:

A. Cables shall be coiled in the in-wall or surface-mount boxes if adequate space is present to house the cable coil without exceeding the manufacturer's bend radius. In hollow wall installations where box-eliminators are used, excess wire can be stored in the wall. No more than 12" of UTP and 36" of fiber slack shall be stored in an in-wall box, modular furniture raceway, or insulated walls. Excess slack shall be loosely coiled and stored in the ceiling above each drop location when there is not enough space present in the outlet box to store slack cable.

B. Cables shall be dressed and terminated in accordance with the recommendations made in the ANSI/TIA/EIA-568-B.1 document, manufacturer's recommendations and best industry

practices.

C. Pair untwist at the termination shall not exceed 12 mm (one-half inch).

D. Bend radius of the horizontal cable shall not be less than 4 times the outside diameter of the cable.

E. The cable jacket shall be maintained to within 25mm (one inch) of the termination point.

F. Data jacks, unless otherwise noted in drawings, shall be located in the bottom position(s) of each faceplate. Data jacks in horizontally oriented faceplates shall occupy the right-most position(s).

G. Voice jacks shall occupy the top position(s) on the faceplate. Voice jacks in horizontally oriented faceplates shall occupy the left-most position(s).

3.3 HORIZONTAL DISTRIBUTION CABLE INSTALLATION:

A. All horizontal voice and data cabling shall be terminated on modular patch panels except for horizontal voice cables serving life safety related functions (fire alarm systems, security systems, elevator communications, etc.). All horizontal voice cabling serving life safety related functions shall be terminated on 110 blocks.

B. The voice and data cables shall be installed in separate patch panels.

C. All wiring above ceilings shall be installed in cable tray or open top cable hangers or in provided conduit.

D. Cable above accessible ceilings shall be supported 60” on center from cable support attached to building structure.

E. Do not untwist cable pairs more than 0.5 in. when terminating.

F. The Contractor shall be responsible for replacing all cables that do not pass Category 6 requirements for data and 5e for the voice applications.

G. Maximum horizontal cable length shall be 90 meters.

H. Cable shall have no physical defects such as cuts, tears or bulges in the outer jacket. Cables with defects shall be replaced.

I. Install cable in neat and workmanlike manner. Neatly bundle and tie all cable in closets. Leave sufficient cable for 90° sweeps at all vertical drops.

J. Do not install Category 6 cable with more than 110N (25 lbs) pull force, as specified in ANSI/TIA/EIA and BICSI TDDM practices. Utilize appropriate cable lubricant in sufficient quantity to reduce pulling friction to acceptable levels on long pulls inside conduit, pulls of multiple cables into a single small bore conduit, on conduit runs greater than 100 lineal feet with bends of opposing directions, and in conduit runs that exceed 180 degrees of accumulated bends. Use of tensile rated cords (i.e. fishing line) should be used for difficult or questionable

pulls - to judge to go/no-go condition of the conduit and pulling setup.

K. Cables jackets that are chaffed or burned exposing internal conductor insulation or have any bare copper (“shiners”) shall be replaced.

L. Test, label and document as called for in contract documents.

M. Firestop all openings where cable is installed through a fire barrier.

3.4 HORIZONTAL CROSS CONNECT INSTALLATION:

A. Cables shall be dressed and terminated in accordance with the recommendations made in the ANSI/TIA/EIA-568-B standard, manufacturer's recommendations and best industry practices.

B. Pair untwist at the termination shall not exceed 13 mm (0.5 inch).

C. Bend radius of the cable in the termination area shall not exceed 4 times the outside diameter of the cable.

D. Cables shall be neatly bundled and dressed to their respective panels or blocks. Each panel or block shall be fed by an individual bundle separated and dressed back to the point of cable entrance into the rack or frame.

E. The cable jacket shall be maintained as close as possible to the termination point.

F. Each cable shall be clearly labeled on the cable jacket behind the patch panel at a location that can be viewed without removing the bundle support ties. Cables labeled within the bundle, where the label is obscured from view shall not be acceptable.

3.5 OPTICAL FIBER TERMINATION HARDWARE:

A. Fiber slack shall be neatly coiled within the fiber splice tray or enclosure. No slack loops shall be allowed external to the fiber panel.

B. Each cable shall be individually attached to the respective splice enclosure by mechanical means. The cables strength member shall be securely attached the cable strain relief bracket in the enclosure.

C. Each fiber bundle shall be stripped upon entering the splice tray and the individual fibers routed in the splice tray.

D. Each cable shall be clearly labeled at the entrance to the splice enclosure. Cables labeled within the bundle shall not be acceptable.

E. A maximum of 12 strands of fiber shall be spliced in each tray

F. All spare strands shall be installed into spare splice trays.

3.6 BACKBONE CABLE INSTALLATION:

A. Raceways:

1. All backbone cables shall be installed inside innerducts (see specification above) within conduits meeting specification requirements unless specifically noted otherwise.
2. Backbone cables shall be installed separately (in separate innerducts/conduits) from horizontal distribution cables.
3. A pull cord (nylon; 1/8" minimum) shall be co-installed with all cable installed in any conduit.
4. Where backbone cables and distribution cables are specifically specified to be installed in a cable tray or wireway, backbone cables shall be installed first, within innerducts meeting specifications above, bundled separately from the horizontal distribution cables.

B. Support:
1. Within Telecommunications Rooms or at Telecommunications Backboards, all backbone cables shall be securely fastened to the backboards on the walls.
2. Backbone cables spanning more than three floors shall be securely attached at the top of the cable run with a wire mesh grip and on alternating floors or as required by local codes.
3. Vertical runs of cable shall be supported to messenger strand, cable ladder, or other method to provide proper support for the weight of the cable.
4. Large bundles of cables and/or heavy cables shall be attached using metal clamps and/or metal banding to support the cables.

3.7 COPPER TERMINATION HARDWARE:

A. Cables shall be dressed and terminated in accordance with the recommendations made in the ANSI/TIA/EIA-568-A/B standard, manufacturer's recommendations and best industry practice.

B. Pair untwist at the termination shall not exceed 12 mm (one-half inch).

C. Bend radius of the cable in the termination area shall not exceed 4 times the outside diameter of the cable.

D. Cables shall be neatly bundled and dressed to their respective panels or blocks. Each panel or block shall be fed by an individual bundle separated and dressed back to the point of cable entrance into the rack or frame.

E. The cable jacket shall be maintained to within 25 mm (one inch) of the termination point.

F. Each cable shall be clearly labeled on the cable jacket behind the patch panel at a location that can be viewed without removing the bundle support ties. Cables labeled within the bundle, where the label is obscured from view shall not be acceptable.

3.8 RACKS:

A. Floor-mount racks shall be used unless specifically shown otherwise.

B. Floor-mount racks shall be securely attached to the concrete floor using a minimum 3/8” hardware or as required by local codes.

C. Racks shall be placed with a minimum of 36 inches clearance from the walls on all sides of the rack. When mounted in a row, maintain a minimum of 36 inches from the wall behind and in front of the row of racks and from the wall at each end of the row.

D. All racks shall be grounded to the telecommunications ground bus bar in accordance with Section 3.11 of this document.

E. Rack mount screws not used for installing patch panels and other hardware shall be bagged and left with the rack upon completion of the installation.

F. Wall mounted termination block fields shall be mounted on 4' x 8' x .75" void free plywood. The plywood shall be mounted vertically 12" above the finished floor. The plywood shall be painted with two coats of grey fire retardant paint.

G. Wall mounted termination block fields shall be installed with the lowest edge of the mounting frame 18" from the finished floor.

H. Rack-mounted patch panels (and the associated horizontal cable management sections) furnished within the contract shall occupy no more than 40% of the available space within the associated racks (also furnished within the contract) unless specifically shown or specified otherwise. A minimum of 60% of available rack space shall be reserved for owner-furnished equipment. Where the number of patch panels and horizontal cable management sections would exceed 40% of the available rack space, an additional rack shall be installed.

3.9 EQUIPMENT TRAY FOR TELECOMMUNICATION ROOMS:

A. All equipment trays shall be 18" in width.

B. Furnish and install 18" equipment tray from each floor mount rack/server cabinet to wall. Furnish 18" equipment tray around wall as required to support cables. A minimum of two (2) walls shall be completely covered by equipment tray.

C. Furnish and install cable retaining posts on each side of tray every 4 feet as required to supports cables.

3.10 FIRESTOP SYSTEM:

A. All firestop systems shall be installed in accordance with the manufacturer's recommendations and shall be completely installed and available for inspection by the local inspection authorities prior to cable system acceptance.

3.11 GROUNDING SYSTEM:

A. The TMGB in the MDF shall be connected to the building electrical entrance grounding facility with a #6 AWG ground. Each TBB in each IDF shall be connected to a ground bus in the MDF with #4/0 AWG minimum ground. The intent of this system is to provide a grounding system that is equal in potential to the building electrical ground system. Therefore, ground loop current potential is minimized between telecommunications equipment and the electrical system to which it is attached.

B. All racks, metallic backboards, cable sheaths, metallic strength members, splice cases, cable trays, etc. entering or residing in the TR or ER shall be grounded to the respective TGB or TMGB using a minimum #6 AWG stranded copper bonding conductor and compression connectors.

C. The TBB shall adhere to the recommendations of the ANSI/TIA/EIA-607 standard, and shall be installed in accordance with best industry practice.

D. Installation and termination of the main bonding conductor to the building service entrance ground shall be performed by the electrical contractor.

3.12 IDENTIFICATION AND LABELING:

A. The contractor shall develop and submit for approval a labeling system for the cable installation. The Owner will negotiate an appropriate labeling scheme with the successful structured cabling contractor. At a minimum, the labeling system shall clearly identify all components of the system: racks, cables, panels and outlets. The labeling system shall designate the cables origin and destination and a unique identifier for the cable within the system. Racks and patch panels shall be labeled to identify the location within the cable system infrastructure. All labeling information shall be recorded on the as-built drawings and all test documents shall reflect the appropriate labeling scheme. Labeling shall follow the guidelines of ANSI/TIA/EIA-606-A.

B. All label printing will be machine generated by Panduit software (or other) using indelible ink ribbons or cartridges. Self-laminating labels will be used on cable jackets, appropriately sized to the OD of the cable, and placed within view at the termination point on each end. Outlet, patch panel and wiring block labels shall be installed on, or in, the space provided on the device.

3.13 TESTING AND ACCEPTANCE:

A. General
1. All cables and termination hardware shall be 100% tested for defects in installation and to verify cabling system performance under installed conditions according to the requirements of ANSI/TIA/EIA-568-B. All pairs of each installed cable shall be verified prior to system acceptance. Any defect in the cabling system installation including but not limited to cable, connectors, feed through couplers, patch panels, and connector blocks shall be repaired or replaced in order to ensure 100% useable conductors in all cables installed.
2. All cables shall be tested in accordance with this document, the ANSI/TIA/EIA standards, the Panduit Certification Program Information Manual and best industry practice. If any of these are in conflict, the Contractor shall bring any discrepancies to the attention of the project team for clarification and resolution.

B. Copper Channel Testing
1. All twisted-pair copper cable links shall be tested for continuity, pair reversals, shorts, opens and performance as indicated below. Additional testing is required to verify Category performance. Horizontal cabling shall be tested using a Level III test unit for category 6 performance compliance, respectively.
2. Continuity - Each pair of each installed cable shall be tested using a test unit that shows opens, shorts, polarity and pair-reversals, crossed pairs and split pairs. Shielded/screened cables shall be tested with a device that verifies shield continuity in addition to the above stated tests. The test shall be recorded as pass/fail as indicated by the test unit in accordance with the manufacturers' recommended procedures, and referenced to the appropriate cable identification number and circuit or pair number. Any faults in the wiring shall be corrected and the cable re-tested prior to final acceptance.

3. Length - Each installed cable link shall be tested for installed length using a TDR type device. The cables shall be tested from patch panel to patch panel, block to block, patch panel to outlet or block to outlet as appropriate. The cable length shall conform to the maximum distances set forth in the ANSI/TIA/EIA-568-B.1 Standard. Cable lengths shall be recorded, referencing the cable identification number and circuit or pair number. For multi-pair cables, the shortest pair length shall be recorded as the length for the cable.
4. Category 6 Performance:
   a. Follow the Standards requirements established in:
      1) ANSI/TIA/EIA-568-B .1, B.2 and B.2-1
   b. A Level III test unit is required to verify category 6 performance.The basic tests required are:
      1) Wire Map
      2) Length
      3) Attenuation
      4) NEXT (Near end crosstalk)
      5) Return Loss
      6) ELFEXT Loss
      7) Propagation Delay
      8) Delay skew
      9) PSNEXT (Power sum near-end crosstalk loss)
      10) PSELFEXT (Power sum equal level far-end crosstalk loss)

C. Fiber Testing
1. All fiber testing shall be performed on all fibers in the completed end to end system. There shall be no splices unless clearly defined in an RFP. Testing shall consist of an end to end power meter test performed per EIA/TIA-455-53A. The system loss measurements shall be provided at 850 and/or 1300 nanometers for multimode fibers and 1310 and/or 1550 nanometers for single mode fibers. These tests also include continuity checking of each fiber.
2. Backbone multimode fiber cabling shall be tested at both 850 nm and 1300 nm (or 1310 and 1550 nm for singlemode) in both directions.
3. Test set-up and performance shall be conducted in accordance with ANSI/EIA/TIA-526-14 Standard, Method B.
4. Where links are combined to complete a circuit between devices, the structured cabling contractor shall test each link from end to end to ensure the performance of the system. ONLY LINK TEST IS REQUIRED. The structured cabling contractor can optionally install patch cords to complete the circuit and then test the entire channel. The test method shall be the same used for the test described above. The values for calculating loss shall be those defined in the ANSI/TIA/EIA Standard.
5. Attenuation testing shall be performed with an approved hand held tester from an industry recognized test equipment manufacturer.

3.14 SYSTEM DOCUMENTATION:

A. Upon completion of the installation, the structured cabling contractor shall provide three (3) full documentation sets to the owners for approval. Documentation shall include the items detailed in the sub-sections below.

B. Documentation shall be submitted within ten (10) working days of the completion of each testing phase (e.g. subsystem, cable type, area, floor, etc.). This is inclusive of all test result and

draft as-built drawings. Draft drawings may include annotations done by hand. Machine generated (final) copies of all drawings shall be submitted within 30 working days of the completion of each testing phase. At the request of the Engineer, the structured cabling contractor shall provide copies of the original test results.

C. The Engineer may request that a 10% random field re-test be conducted on the cable system, at no additional cost, to verify documented findings. Tests shall be a repeat of those defined above. If findings contradict the documentation submitted by the structured cabling contractor, additional testing can be requested to the extent determined necessary by the Engineer, including a 100% re-test. This re-test shall be at no additional cost to the Owner.

3.15 TEST RESULTS:

A. Test documentation shall be provided on disk within three weeks after the completion of the project. The disk shall be clearly marked on the outside front cover with the words “Project Test Documentation”, the project name, and the date of completion (month and year). The results shall include a record of test frequencies, cable type, conductor pair and cable (or outlet) I.D., measurement direction, reference setup, and crew member name(s). The test equipment name, manufacturer, model number, serial number, software version and last calibration date will also be provided at the end of the document. Unless the manufacturer specifies a more frequent calibration cycle, an annual calibration cycle is anticipated on all test equipment used for this installation. The test document shall detail the test method used and the specific settings of the equipment during the test as well as the software version being used in the field test equipment.

B. The field test equipment shall meet the requirements of ANSI/TIA/EIA-568-A/B including applicable TSB’s and amendments. The appropriate Level III tester shall be used to verify Category 6 cabling systems.

C. Test results generated for each cable by the wire (or fiber) test instrument shall be submitted as part of the documentation package. The structured cabling contractor must furnish this information in electronic form (CD-ROM).

D. When repairs and re-tests are performed, the problem found and corrective action taken shall be noted, and both the failed and passed test data shall be documented.

3.16 AS-BUILT DRAWINGS:

A. The drawings are to include cable routes and outlet locations. Outlet locations shall be identified by their sequential number as defined elsewhere in this document. Numbering, icons, and drawing conventions used shall be consistent throughout all documentation provided. The Owner will provide floor plans in paper and electronic (DWG, AutoCAD rel. 2002) formats on which as-built construction information can be added. These documents will be modified accordingly by the structured cabling contractor to denote as-built information as defined above and returned to the Owner.

B. The Contractors shall annotate the base drawings and return a hard copy (same plot size as originals) and electronic (AutoCAD DWG) form.

3.17 WARRANTY:

A. The manufacturer shall provide a 25 year extended product warranty with a 25 year applications assurance warranty. Manufacturer shall provide the warranty directly to the end user.

B. An Extended Product Warranty shall be provided which warrants functionality of all components used in the system for 25 years from the date of registration. The Extended Product Warranty shall warrant the installed horizontal copper and the backbone optical fiber portions of the cabling system.

C. The Application Assurance Warranty shall cover the failure of the wiring system to support current or future applications that are designed for the link/channel specifications of ANSI/TIA/EIA–568-B.1. These applications include, but are not limited to, 10BASE-T, 100BASE-T, 1000BASE-T, and 155 Mb/s ATM.

D. The contractor shall provide a warranty on the physical installation.

3.18 FINAL ACCEPTANCE & SYSTEM CERTIFICATION:

A. Completion of the installation, in-progress and final inspections, receipt of the test and as-built documentation, and successful performance of the cabling system for a two week period will constitute acceptance of the system. Upon successful completion of the installation and subsequent inspection, the end user shall be provided with a numbered certificate, from the manufacturer, registering the installation.

END OF SECTION 27 10 00

SECTION 27 41 00

TELEVISION DISTRIBUTION SYSTEM

PART 1 - GENERAL

A. The contractor shall provide and install a complete television distribution system as specified herein and as shown on the plans together with all accessories required to provide a complete operating system.

B. Equipment manufacturer name and model numbers specified are provided to establish quality of equipment and system operational features. Any proposed substitution of equipment from that specified must be approved by the Architect within ten (10) days prior to bid date.

C. The entire system shall be guaranteed for a period of one (1) year from the date of final acceptance of the installation and the Contractor shall repair or replace defective equipment, during this period, at no cost to the owner.

D. The system shall be designed to receive and distribute channels to all TV locations.

PART 2 - PRODUCTS

A. The line splitters shall be 2-way and 4-way as required and shall be Blonder Tongue SCVS series.

B. The directional couplers shall be Blonder Tongue SRT series as required.

C. The television distribution amplifier shall be Blonder Tongue BIDA550-50 and shall receive its input from Cable TV Company and other locations shown on the plans.

D. The receiver outlet shall consist of suitable connector mounted to wall plate. The receiver outlet shall be installed at all locations shown on the drawings.

E. All distribution cable shall be low-loss coaxial type, plenum-rated RG-6U (as manufactured by West Penn or Belden). See Specification Section 27 05 00 for additional requirements.

F. All head-end equipment shall be rack-mounted.

G. Provide filters, amplifiers, and any miscellaneous items required to rebroadcast the signal at the proper level for each channel.

H. All copper circuits routed between or outside of buildings shall be provided with a surge protection device at each end. The surge protection device shall be labeled as meeting the requirements of UL 96A (exact requirements shall be coordinated with the lightning protection system supplier, where applicable).

PART 3 - EXECUTION

A. Wiring shall be in strict accordance with the National Electrical Code and all state and local

regulations. Wiring shall be installed in accordance with manufacturer's wiring diagrams and shall test free from ground, opens and short circuits.

B. All connections shall be made under the direct supervision of a qualified technician.

C. All cables shall be terminated.

D. Wiring for the Television Distribution System is based on one manufacturer's recommendation. This contract requires that the installed wire be in accordance with the accepted manufacturer's recommendations.

E. Refer to Specification Section 27 05 00 for additional installation requirements.

F. Upon completion of job, the entire system shall be tested and a certificate shall be forwarded to the Architect be technician stating that he has personally verified the the following:
1. System is in accordance with specifications.
2. System is in correct operating condition.

END OF SECTION 27 41 00

SECTION 28 0723

SECURITY MANAGEMENT SYSTEM

PART 1 – GENERAL

1.1 CONDITIONS AND REQUIREMENTS

A. The General Conditions, Supplementary Conditions, and Division 01 P General Requirements apply.

1.2 SECTION INCLUDES

A. General description, functional requirements, operational characteristics, and criteria for the Security Management System (SMS).

1.3 RELATED SECTIONS

A. Division 26 - Electrical.

B. Division 8 - Door Hardware.

1.4 DEFINITIONS

A. API: Application Programming Interface.

B. LDAP: Lightweight Directory Access Protocol.

C. NTSC: National Television Standards Committee.

D. PAL: Phase Alternating Line. PAL is the color video standard used in Europe and many other countries.

E. SMS: Security Management System.

1.5 REFERENCE STANDARDS

A. Where more than one (1) reference standard, code, or regulation applies, the more stringent one shall govern.

B. Electronic Industries Alliance (EIA):
1. EIA RS-170 - Standard for Composite Video Signals.

C. Federal Communications Commission (FCC).
1. FCC Part 15 - Unlicensed RF Devices.
2. FCC Part 68 - Requirements for Connecting to the U.S. Phone Network.

D. Institute of Electrical and Electronics Engineers, Inc. (IEEE).

E. International Organization for Standardization (ISO).

F. International Radio Consultive Committee (CCIR).

G. Microsoft® Open Database Connectivity (ODBC) Interface.

H. National Fire Protection Association (NFPA):
1. NFPA 70 - National Electrical Code.

I. National Institute of Standards and Technology (NIST):
1. Federal Information Processing Standards Publication (FIP PUBS 197) - Specification for the Advanced Encryption Standard (AES).

J. National Television Standards Committee (NTSC):
1. Color Camera Broadcast Standard.

K. Underwriters Laboratories Inc. (UL):
1. UL 294 - Standard for Access Control System Units.
2. UL 1076 - Standard for Proprietary Burglar Alarm Units and Systems.

1.6 ACCESS CONTROL SYSTEM SHALL BE ONE OF THE FOLLOWING SYSTEMS

A. Honeywell Corporate ProWatch System vs 3.8.

B. Lenel OnGuard vs 6.4

C. Software House c Cure 9000 Enterprise

1.7 SECURITY MANAGEMENT SYSTEM (SMS) DESCRIPTION

A. The Security Management System (SMS) outlined in this section and detailed in Part 2 of this section is the key central component for managing physical security and the bridge between physical and logical security for a project. The system shall provide a variety of integral functions including: regulation of access and egress; provision of identification credentials; monitor, track and interface alarms.

B. The SMS shall utilize a single seamlessly integrated relational database for all functions utilizing a fully multi-tasking multi-threading Microsoft Windows 7 or 2008 or Vista or XP or 2003 Operating System. The SMS shall be written so that all system modules (access control, alarm monitoring, ID or credential management, visitor management, asset management and digital video management) are developed and built from a unified single 32-bit source code set. Separate source code bases for individual modules of the SMS are not acceptable.

C. Upgrades or expansion of the SMS to a larger size system in scale shall not require installation of a different and/or new SMS application or require the administrator or operator to learn a different and or new interface from the previous version.

D. The SMS shall be written using Unicode format. Unicode enables a single software product to be targeted across multiple platforms and languages without re-engineering and allows for data to be transported through different systems without corruption. Language Accessory Add-ons shall require a special language-specific license bit in order for the Language Pack to be used. E. The SMS software developer shall be a Microsoft Gold Certified Partner.

F. The SMS shall be Microsoft Windows XP Certified.

G. The SMS shall be compatible with Microsoft Windows 7, and shall have passed Microsoft-designed tests for compatibility and reliability on Windows 7.

H. The SMS shall be UL 1076 Listed (pending).

I. The SMS shall have FIPS 140-2 certification (pending).

J. The SMS shall only require a single license key to be present on the database server for the SMS to operate. The license key shall either be a physical device or a software license key. The SMS shall allow the SMS USER the ability to activate, return, or repair the software license key. The software license shall only be used on a physical computer or in a VMware virtual environment. License keys shall not be required at the client workstations. The license key on the database server shall determine the number of client workstations that shall be able to connect to the SMS as well as all SMS functionality. An alarm shall be generated in the SMS's Alarm Monitoring application as the license expiration date approaches.

K. The License Administration login and password shall be encrypted when they are passed to the License Server. The hash shall not be the same data even with the same logon credentials on different systems. This is a requirement for U.S. government DIACAP certification.

L. The SMS shall support concurrent licensing with respect to client licenses. CUSTOMER shall purchase a fixed number of client workstation licenses (or connections) that shall be programmed into the database server license file. The SMS shall be installed on any number of client workstations in the CUSTOMER facility. Then, any of the client workstations that have the SMS software installed shall have the ability to connect to the database server as long as the maximum number of concurrent connections purchased has not been reached. Connections shall be licensed on a per module basis. This shall provide CUSTOMER with great flexibility in system design and layout.

M. The SMS shall provide support for single sign-on capability. Single sign-on shall allow System Administrators/System Operators to authenticate into SMS applications using their Windows domain account.

N. Single sign-on shall support the following scenarios:

1. Allow System Administrators/System Operators to interactively run SMS applications without having to enter a username or password. This shall make administration of the SMS easier since maintenance of separate SMS usernames and passwords is not required.

2. Allow SMS API scripts to authenticate. These scripts shall be run using a Windows account allowing a seamless and secure way to authenticate the account and restricting the script to those actions that the user is permitted to perform.

O. The SMS shall be able to seamlessly interface with and monitor intelligent system controllers, reader interface modules, I/O panels, alarm panels, alarm panel receivers, biometric devices, personal protection devices, intercom systems, fire alarm panels (secondary monitoring only), building management systems and digital video recorders approved for use by the SMS manufacturer.

P. The SMS shall be able to communicate with intelligent system controllers via RS-485, RS-232, TCP/IP or Ethernet, and dialup via modem.

Q. Tasks shall be accessible from any compatible client workstation on the network utilizing one (1) or all of the following:

1. Traditional client-server architecture.
2. N-tier architecture where the SMS supports the expansion of the system architecture and allows for user deployment based upon their system architectural needs. The SMS shall allow for, but not require, the separation of the database, application server, Web server, and client interface. The system shall require that all connections to the database be performed through a trusted link from the client or internet browser interface.
3. Centralized distribution (publishing) of applications using Windows Terminal Server and Citrix® on Windows, UNIX, Linux or Apple Macintosh based systems through any compatible internet browser application and/or by means of a mobile computing platform using a wearable computer, Tablet PC, or PDA device.

R. Utilize an open architecture where all data must reside on a single database and must be accessible in real time to SMS workstation or Web-based client connected to the network. The system shall be configurable to support all of the following databases: Microsoft SQL Server 2008, Microsoft SQL Server 2005, Oracle Server 11g, and Oracle Server 10g. Oracle data may reside on Windows or UNIX platforms.

S. The system architecture shall support Microsoft Windows Clustering, Hot Standby, Fault Tolerant Servers and Fault Tolerant Hot Standby Servers.

T. The SMS shall be able to connect to and interface bi-directionally with external data sources utilizing all of the following methods:

1. ASCII with support for XML formatted text exchange of data activated both manually and automatically.
2. ASCII with support for XML formatted text exchange of data using a direct table interface activated both manually and automatically.
3. Real-time exchange of data via Active Directory or LDAP utilizing an API (Application Programming Interface) written by the SMS manufacturer. The live exchange of data shall expose SMS events and transactions to other data sources in real-time and allow for receipt of data into the SMS where this data may be acted upon and trigger linked events in the SMS in real-time.

U. All exterior cameras will be grouped in such a manner as to allow access by owner and Elmore County Sheriff's Department. All interior cameras will be grouped in such a manner as to allow access by owner only.

1.8 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. Reference each product to a location on Drawings.

1. Manufacturer's technical data for all material and equipment at the system and sub system level to be provided as part of the SMS.

2. A system description including analysis and calculations used in sizing equipment required by the SMS. The description shall show how the equipment will operate as a system to meet the performance requirements of the SMS. The following information shall be supplied as a minimum:

a. Server(s) processor(s), disk space and memory size.
b. Description of site equipment and its configuration.
c. Network bandwidth, latency and reliability requirements.
d. Backup or archive system size and configuration.
e. Start up operations.
f. System expansion capability and method of implementation.
g. System power requirements and UPS sizing.
h. Device or component environmental requirements (cooling and or heating parameters).
i. A description of the operating system and application software.

B. Shop Drawings: Submit plans, elevations, sections, details, and attachments to other work.
1. Indicate all system device locations on architectural floor plans. No other system(s) shall be Included on these plans.
2. Include full schematic wiring information on these drawings for all devices. Wiring Information shall include cable type, conductor routings, quantities, and connection details at device.
3. Include a complete SMS one-line, block diagram.
4. Include a statement of the system sequence of operation.

C. Operation and Maintenance Data: For electronic security system to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 01 78 23, include the following:
1. Provide Six (6) sets electronic format manuals including operating instructions, maintenance recommendations and parts list including wiring and connection diagrams modified to reflect as-built conditions.
2. Manuals: Deliver final copies of the manuals within thirty (30) days after completing the installation test. Each manual's contents shall be identified on the cover. The manual shall include names, addresses, and telephone numbers of the Contractor responsible for the installation and maintenance of the system and the factory representatives for each item of equipment for each system. The manuals shall have a table of contents and labeled sections. The final copies delivered after completion of the installation test shall include all modifications made during installation, checkout, and acceptance testing. The manuals shall consist of the following:

a. Functional Design Manual: Identify the operational requirements for the system and explain the theory of operation, design philosophy, and specific functions. Include a description of hardware and software functions, interfaces, and requirements.
b. Hardware Manual: Describe equipment furnished including:
    1) General description and specifications.
    2) Installation and check out procedures.
    3) Equipment layout and electrical schematics to the component level.
    4) System layout drawings and schematics.

5) Alignment and calibration procedures.
6) Manufacturer's repair parts list indicating sources of supply.

c. Software Manuals: Describe the functions of software and include all other information necessary to enable proper loading, testing, and operation. The manual shall include:
1) Definition of terms and functions.
2) System use and application software.
3) Initialization, startup, and exit.
4) Reports generation.
5) Details on forms customization and field parameters.

3. As-Built Drawings: During system installation, the Contractor shall maintain a separate hard copy set of drawings, elementary diagrams, and wiring diagrams of the SMS to be used for record drawings. This set shall be accurately kept up to date by the Contractor with all changes and additions to the SMS. Copies of the final as-built drawings shall be provided to the end user in DXF format.

1.9 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. SMS manufacturer shall be an established organization with referenced and documented experience delivering and maintaining SMS of equal or higher sophistication and complexity as compared to the system detailed in this specification.
2. SMS manufacturer shall employ at a minimum the following methods for quality assurance of component and assembly devices.
a. Perform visual inspection of devices to verify assembly according to defined procedures. Perform end of line operational tests to ensure product functionality has been correctly configured.
3. Perform individual functionality and system level regression testing to ensure compliance with product specifications. Perform single and multiple unit system tests to mimic end-user installation configurations. Utilize automated hardware and software testing to evaluate system performance under published operational loads and compare to published system capabilities.

B. Bidder Qualifications:

1. At the time of the bid, the bidder shall have satisfactorily completed projects of a similar size, scope and complexity as the system detailed in this specification. The bidder shall furnish written proof of experience from three (3) references and proof of current accreditation or certification by the manufacturer for required training for sales or installation or service of the SMS and associated devices.
2. Bidder shall be a Microsoft Certified Partner
3. The bidder shall also be a factory authorized local service organization that shall carry a complete stock of parts and provide maintenance for the SMS and related systems under this contract. Local shall be defined as an area in a 75 mile radius of installed location.

1.10 DELIVERY, STORAGE AND HANDLING

A. Deliver, store, and handle materials, components, and equipment in manufacturer's protective packaging.

B. Store components and equipment in temperature and humidity controlled environment in original manufacturer's sealed containers. Maintain ambient temperature between 50 and 85 degrees Fahrenheit (10 and 29.4 degrees Celsius), and not more than 80 percent relative humidity, non-condensing.

C. Open each package; verify contents against packing list; and file copy of packing list, complete package identification, for inclusion in operation and maintenance data.

D. Mark packing list with the same designations assigned to materials, components, and equipment for recording in the system labeling schedules that are generated by software.

E. Save original manufacturer's containers and packing materials and deliver as directed under provisions covering extra materials.

1.11 PROJECT CONDITIONS

A. Environmental Conditions: System shall be capable of withstanding the following environmental conditions without mechanical or electrical damage or degradation of operating capability:
   1. Equipment and Components: Rated for continuous operation in ambient conditions of 60 to 85 degrees Fahrenheit (15.5 and 29.4 degrees Celsius) and a relative humidity of 20 to 80 percent, non-condensing.
   2. Indoor, Controlled Environment: NEMA 250, Type 1 enclosure. System components, except the central-station control unit, installed in [air-conditioned] [temperature- controlled] indoor environments shall be rated for continuous operation in ambient conditions dry bulb and 20 to 90 percent relative humidity, non-condensing.
   3. Indoor, Uncontrolled Environment: NEMA 250, [Type 3R] [Type 4] [Type 12] [Type 12K] enclosures. System components installed in [non-air-conditioned] [non-temperature-controlled] indoor environments shall be rated for continuous operation in ambient conditions dry bulb and 20 to 90 percent relative humidity, non-condensing.

1.12 WARRANTY

A. Guarantee equipment and labor and provide maintenance and services as follows: WARRANTY REQUIREMENTS FOR ALL SYSTEM COMPONENTS (LABOR and MATERIAL): 5 year (60 month) warranty on parts and labor for the access control system shall be included with bid.

B. This 60-month warranty shall include the following elements:

   1. 8-5, M-F Service, Service Provider must be same as bidder.
   2. Web Portal for creating service tickets and tracking service requests.
   3. Priority queue for service requests.

4. Electrical Surge Protection coverage.
5. Guaranteed Emergency Response - four (4) hours.
6. Guaranteed Non-Emergency Response - six (6) business hours.
7. Remote System Help Desk Support for Technical Support - 1 time per quarter.
8. Software License Technical support agreements and Installation of annual software updates 1 per year for 5 years.
9. On-Site System Review and Audit of System Functionality - 1 time per year.
10. Component Integrity Inspections - 2 times per year.
11. Replacement of Disposable Parts as needed (batteries, bulbs, connectors, etc.).
12. Training for office personnel on system functionality - 2 times per year.

1.13 SMS STARTUP AND COMMISSIONING

A. Entire security management system shall be commissioned by the manufacturer or manufacturer's representative.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Basis-of-Design Manufacturer: The security management system is based on products of Lenel Systems International, Inc., 1212 Pittsford-Victor Road, Pittsford, NY 14534; telephone: 585-248-9720, fax: 585-248-9185; Web site: www.lenel.com.

B. Honeywell Integrated Security, 135 West Forest Hill Avenue, Oak Creek, WI 53154; Phone: 414-766-1700, Fax: 414-766-1798; Web site: www.HoneywellIntegrated.com.

C. Software House, 6600 Congress Avenue, Boca Raton, FL 33487; Phone: 800 507 6268; Web site: www.swhouse.com.

2.2 ACCESS CONTROL CREDENTIAL READERS

A. Proximity Card Readers P Single-Gang Box Mounting (Thinline II)

1. Provide surface mounting style 125 KHz proximity card readers suitable for wall or US 2-S single-gang box mounting, and for mounting configurations as shown on the project plans.
2. The reader shall be capable of reading access control data in standard Wiegand formats up to 84 bits in length from any HID Proximity card or equivalent, outputting the data in one of the following configurations:
   a. The card reader shall output credential data in compliance with the SIA AC-01 Wiegand standard, compatible with all standard access control systems.
   b. The card reader shall output credential data using a Clock and Data interface, and be compatible with systems requiring a magnetic stripe reader.
3. The reader shall be capable of outputting a periodic reader supervision message at a configurable time interval, enabling the host system to signal an alarm condition based on the absence of this message.
4. The Proximity card reader shall provide the ability to change operational features in the field through the use of a factory-programmed command card. Command card operational programming options shall include:
   a. Reader beeps and flashes green on a card read, LED normally red, single line control of LED.

b. Reader flashes green on a card read, LED normally red, single line control of LED.
c. Reader beeps on a card read, LED normally red, single line control of LED.
d. Beeper and LED are controlled by host only, LED normally red, single line control of LED.
e. Reader beeps and flashes green on a card read, LED normally off, red and green LED's controlled individually.
f. Reader flashes green on a card read, LED normally off, red and green LED's controlled individually.
g. Reader beeps on a card read, LED normally off, red and green LED's controlled individually.
h. Beeper and LED are controlled by host only, LED normally off, red and green LED controlled individually
i. Change from Wiegand to Mag Stripe output format
j. Change from Mag Stripe to Wiegand output format
k. Reset to Factory Defaults

5. Proximity card readers shall provide the following programmable audio/visual indication:
a. A piezoelectric sounder shall provide an audible tone upon successful power up/self test, good card read, or whenever the beeper control line is asserted by the host.
b. A bi-color, red/green LED shall light upon successful power up/self test, good card read, or whenever the LED control line(s) are asserted by the host.
c. The reader shall have individual control lines for the sounder, and for red and green LED indication. When the LED control lines are asserted simultaneously, an amber LED indication will occur.
6. The reader shall have a configurable hold input, which when asserted shall either buffer a single card read or disable the reader, until the line is released. This input may be used for special applications or with loop detectors.
8. The reader shall require that a card, once read, must be removed from the RF field for one second before it will be read again, to prevent multiple reads from a single card presentation and anti-passback errors.
9. Typical proximity card read range shall be:
a. 5.5” (14cm) using HID Proxcard II card.
b. 2” (5.1 cm) using HID ProxKey II key fob
c. 3” (7.6 cm) using HID Microprox Tag
d. 1.5” (3.8 cm) using HID Prox/Wiegand Card
10. Proximity card readers shall meet the following physical specifications:
a. Dimensions: 4.70 x 3.0 x 0.68” (11.9 x 7.6 x 1.7 cm)
b. Weight: 3.3.oz (94 g)
c. Material: UL94 Polycarbonate
d. Two-part design with separate reader body and cover.
e. Color: Black, Gray, White or Beige as approved by the project architect.
11. Proximity card readers shall meet the following electrical specifications:
a. Operating voltage: 5P 16 VDC, reverse voltage protected. Linear power supply recommended.
b. Current requirements: (average/peak) 20/115mA @ 12 VDC 13. Proximity card readers shall meet the following certifications:

a. UL 294
b. Canada/UL 294
c. FCC Certification

14. Proximity card readers shall meet the following environmental specifications:
a. Operating temperature: -22 to 150 degrees F (-30 to 65 degrees C)
b. Operating humidity: 0% to 95% relative humidity non-condensing
c. Weatherized design suitable to withstand harsh environments The reader shall be of potted, polycarbonate material, sealed to a NEMA rating of 4X (IP55).

15. Warranty of Proximity card readers shall be lifetime against defects in materials and workmanship.

2.3 PROXIMITY CARDS

A. Furnish 150 proximity cards for owner's use.

2.4 PANIC BUTTONS

A. Panic buttons at clerical stations shall be United Security Products HUB-ES emergency switch mounted to casework.

B. Wall mounted panic buttons shall be a mushroom style push-button located at 48" AFF with plexiglass cover.

2.5 DOOR CONTACT SWITCHES

A. Door contact switches shall be GE Security 1072 recess mounted magnetic contacts. Coordinate exact location with door hardware supplier.

2.6 SERVER AND WORKSTATION REQUIREMENTS

A. Contractor shall furnish Cisco switches (exact model to be approved by DHR) for all Security Management System needs.

B. Database Servers
1. Servers for Windows 2008 or 2003 Access Control and Alarm Monitoring Systems
a. Dell PowerEdge R710
b. Intel® Xeon® E5520, 2.26Ghz, 8M Cache, Turbo, HT, 1066MHz
c. 4GB Memory (2x2GB), 1066MHz Dual Ranked UDIMMs for 1 Processor, Adv ECC
d. 24X IDE CD-RW/DVD ROM Drive
e. 160GB 7.2K RPM SATA 2.5" Hot Plug Hard Drive for Operating System
f. 160GB 7.2K RPM SATA 2.5" Hot Plug Hard Drive for Database
g. RD1000 Backup, Internal SATA Drive Bay for 2.5" Chassis
h. RD1000 Internal Removable Hard Disk for RD1000, 160GB Native / 320GB Comp
i. Four 10/100/1000 Ethernet Network Ports
j. 17 in. Flat LCD Monitor
k. Onboard VGA
l. 1 serial port
m. 6 USB 2.0 ports
n. Speakers

o. USB Keyboard
p. USB Optical Mouse
q. Surge Suppression Strip
r. Microsoft Windows Server 2008 or 2003 Operating System
s. Microsoft SQL Server 2008 or 2005 Relational Database Management System
t. SMS Server Software for Windows 2008 or 2003

2. Servers for Windows 2008 or 2003 PRO Access Control and Alarm Monitoring Systems
a. Dell PowerEdge R710
b. Intel® Xeon® E5520, 2.26Ghz, 8M Cache, Turbo, HT, 1066MHz Max Mem
c. 4GB Memory (2x2GB), 1066MHz Dual Ranked UDIMMs for 1 Processor, Adv ECC
d. 24X IDE CD-RW/DVD ROM Drive
e. 160GB 7.2K RPM SATA 2.5" Hot Plug Hard Drive for Operating System
f. 160GB 7.2K RPM SATA 2.5" Hot Plug Hard Drive for Database
g. RD1000 Backup, Internal SATA Drive Bay for 2.5" Chassis
h. RD1000 Internal Removable Hard Disk for RD1000, 160GB Native/320GB Comp
i. Four 10/100/1000 Ethernet Network Ports
j. Onboard VGA
k. 17 in. Flat LCD Monitor
l. 1 serial port
m. 6 USB 2.0 ports
n. Speakers
o. USB Keyboard
p. USB Optical Mouse
q. Surge Suppression Strip
r. Microsoft Windows Server 2008 or 2003

s. Microsoft SQL Server 2008 or 2005 Relational Database Management System
t. SMS Server Software for Windows 2008 or 2003

3. Servers for Windows 2008 or 2003 Credential Management Systems
a. Dell PowerEdge R710
b. Intel® Xeon® E5520, 2.26Ghz, 8M Cache, Turbo, HT, 1066MHz Max Mem
c. 4GB Memory (2x2GB), 1066MHz Dual Ranked UDIMMs for 1 Processor, Adv ECC
d. 24X IDE CD-RW/DVD ROM Drive
e. 160GB 7.2K RPM SATA 2.5" Hot Plug Hard Drive for Operating System
f. 160GB 7.2K RPM SATA 2.5" Hot Plug Hard Drive for Database
g. RD1000 Backup, Internal SATA Drive Bay for 2.5" Chassis
h. RD1000 Internal Removable Hard Disk for RD1000, 160GB Native/320GB Comp
i. Four 10/100/1000 Ethernet Network Ports
j. Onboard VGA
k. 17 in. Flat LCD Monitor
l. 1 serial port
m. 6 USB 2.0 ports
n. Speakers
o. USB Keyboard

p. USB Optical Mouse
q. Surge Suppression Strip
r. Microsoft Windows Server 2008 or 2003 Operating System
s. Microsoft SQL Server 2008 or 2005 Relational Database Management System
t. SMS Server Software for Windows 2008 or 2003 4. Servers for Windows 2008 or 2003 Integrated Systems
a. Dell PowerEdge R710
b. Intel® Xeon® E5520, 2.26Ghz, 8M Cache, Turbo, HT, 1066MHz Max Mem
c. 4GB Memory (2x2GB), 1066MHz Dual Ranked UDIMMs for 1 Processor, Adv ECC
d. 24X IDE CD-RW/DVD ROM Drive
e. 160GB 7.2K RPM SATA 2.5" Hot Plug Hard Drive for Operating System
f. 160GB 7.2K RPM SATA 2.5" Hot Plug Hard Drive for Database
g. RD1000 Backup, Internal SATA Drive Bay for 2.5" Chassis
h. RD1000 Internal Removable Hard Disk for RD1000, 160GB Native/320GB Comp
i. Four 10/100/1000 Ethernet Network Ports
j. Onboard VGA
k. 17 in. Flat LCD Monitor
l. 1 serial port
m. 6 USB 2.0 ports
n. Speakers
o. USB Keyboard
p. USB Optical Mouse
q. Surge Suppression Strip
r. Microsoft Windows Server 2008 or 2003 Operating System
s. Microsoft SQL Server 2008 or 2005 Relational Database Management System
t. SMS Server Software for Windows 2008 or 2003

B. Client Workstations PC Specifications

1. Client Workstations for Windows 2008 or 2003 SYSTEMS

a. Intel Pentium 4 Dual Core E2180, 2.0GHz, 1M L2 Cache, 800FSB
b. 1GB non-ECC, 667MHz DDR2 1x1GB (1DIMM)
c. 24X CD-RW/DVD Combo Drive
d. 80GB SATA II 3.0Gb/s, 8MB Cache, 7200 RPM hard drive
e. 10/100/1000 Ethernet Network Port
f. 1 serial port
g. 1 parallel port
h. 8 USB 2.0 ports
i. 17 in. Flat LCD Monitor
j. 64 MB Video Card
k. Speakers
l. USB Keyboard
m. USB Optical Mouse
n. Surge Suppression Strip
o. Microsoft Windows XP or Vista
p. Microsoft SQL Server 2008 or 2005 Client License

q. SMS Client Software for Windows XP or Vista
2. System Administration only
a. Dell OptiPlex 780 Small Form Factor
b. Intel® Pentium® Dual Core E5300 with VT (2.60GHz, 2M, 800MHz FSB)
c. 4GB DDR3 Non-ECC SDRAM, 1066MHz, (4 DIMM)
d. 8X Slimline DVD+/-RW
e. 160GB 7,200 RPM 3.5" SATA, 3.0Gb/s Hard Drive with NCQ and 8MB Cache
f. 10/100/1000 Ethernet Network Port
g. 1 serial port
h. 1 parallel port
i. 8 USB 2.0 ports
j. 19 in. Flat LCD Monitor
k. Integrated Video, Intel® GMA 4500
l. Internal Chassis Speakers
m. USB Keyboard
n. USB Optical Mouse
o. Surge Suppression Strip
p. Microsoft Windows 7
q. Microsoft SQL Server 2008 Client License
r. SMS Client Software for Windows 7
3. High Performance Video Viewing
a. Dell T3500 Precision Workstation
b. Intel® Quad Core Xeon® W3520 2.66GHz, 8M L3, 4.8GT/s, Turbo
c. 4GB, 1066MHz, DDR3 SDRAM, NECC (4 DIMMS)
d. 16X DVD+/-RW
e. 250GB SATA 3.0Gb/s with NCQ and 8MB DataBurst Cache
f. 10/100/1000 Ethernet Network Port
g. 1 serial port
h. 8 USB 2.0 ports
i. 19 in. Flat LCD Monitor
j. Dual 256MB NVIDIA® Quadro® NVS 295, 4MON, 4DP w/ 4DP to DVI Adapt k. Internal Chassis Speakers
l. USB Keyboard
m. USB Optical Mouse
n. Surge Suppression Strip
o. Microsoft Windows 7
p. Microsoft SQL Server 2008 Client License
q. SMS Client Software for Windows 7

2.7 COMPONENTS

A. SMS Software Capabilities: Support an unlimited number of card readers, input points, video cameras, intrusion detection points, and relay outputs. The SMS database server shall support an unlimited number of cardholders, visitors, and assets limited only by the available memory on the ISC. The database server shall also support an unlimited number of system events and

System Operator transactions in the history file limited only by available hard disk space. Client Workstations shall be limited only by the limitations of the operating system server software. The SMS functions are catergorizedinto nineteen primary “system modules” which shall include:

1. Access Control
    a. One of the SMS's primary purposes shall be to provide access control. The SMS shall be able to make access granted or denied decisions, define access levels, and set timezones and holidays. An input or output linkage feature shall allow linking of monitor zone points to output control points within Intelligent System Controllers (ISCs). The SMS shall support features such as area control (two man control, hard, soft, and timed anti-passback), database segmentation, and timezone or holiday overrides.
2. Alarm Monitoring
    a. The main Alarm Monitoring window shall provide information about the time and location of the alarm, along with its priority. The main Alarm Monitoring window must be able to sort pending and/or insert new alarms based on any of the following attributes: priority, date or time, alarm description, Intelligent System Controller, Card Reader, Input Control Module, asset name, or cardholder. Date or time sorts must be System Operator selectable to be either ascending or descending and must have the option of displaying the seconds of the minute in which the alarm arrived into the SMS. All columns of information in the main Alarm Monitoring window shall be able to be arranged in any order by the System Operator.
    b. The SMS must allow unique emergency instructions to be specified for each type of alarm. It shall also allow for the automatic sending of alphanumeric pages or e-mail messages upon alarm arrival. A real-time graphical system status tree on the screen shall indicate if card readers, alarm panels, digital video recorders, video cameras, intrusion detection panels, or Intelligent System Controllers are secured, unsecured, in alarm, or offline. Output control operations must be available to lock, unlock or pulse control points as a standard feature. An automatic cardholder call-up feature shall allow the quick search and display of images in the database. A System Operator journal shall be available to log important daily events. A trace function shall be available for System Operators to locate and track activity on specific cardholders, assets, video cameras, or card readers. An image comparison feature must be provided for use in conjunction with a CCTV interface. All alarms and hardware icons MUST have the ability to control the associated hardware via right-mouse clicks.

    c. The SMS must provide the option to be used as a UL 1981 Classified Central Station Automation System. This option must be classified by Underwriters Laboratories for use as a Commercial Burg Central Station Automation System, to allow the monitoring station where it is used to be made compliant with the UL 1981 standard and listed by UL. This classification shall apply to alarm panels monitored through a connected, UL approved Central Station Alarm Receiver.
3. Credential Management

a. The SMS shall include a seamlessly integrated credential management module. The credential management functionality must allow the enrollment of cardholders into the database, capturing of images, biometric data, and signatures, as well as the import or export of employee data. This functionality shall also allow the System Operator to assign and/or modify the access rights of a cardholder.
b. The SMS shall include a seamlessly integrated state-of-the-art, 32-bit, credential creation and production system. This shall allow for the creation of different badge types based on a database field, the linking of that field to a badge type to automate the process of credential production, and the use of security colors, chromakey, and ghosting, to allow officers to quickly identify personnel access authority.
c. The SMS shall have capabilities for biometric verification. Through the enrollment and comparison of hand geometry (the size of an individual's hand and fingers), or fingerprints, the identity of an individual shall be verified.
d. The SMS shall have the ability to crop and rotate an image automatically based on the orientation of the eyes found in the image. This shall include photographs captured from digital cameras, live cameras, scanned images and imported images.

4. Visitor Management
   a. The SMS shall include a visitor management module. The visitor management module shall be an application utilizing technology that allows a CUSTOMER to enroll and track visitors of the organization.
   b. The visitor management module shall allow a CUSTOMER to enroll visitors, sign them in or out, capture a photo, and capture a driver's license or passport. The visitor management module shall allow System Operators to enter and preschedule visits. The visitor management module shall allow System Operators to print visitor badges.
5. Remote Access Level Management
   a. The SMS shall include a seamlessly integrated remote access level management module.The remote access level module shall be a desktop-based application technology that allows CUSTOMER managers to assign and remove access levels to and from cardholders in the existing SMS database. All transactions relating to the adding and/or removal of access levels shall be recorded complete with a time and date stamp and the System Operator who made the change.
6. System Administration
   a. System Administrative tasks such as defining client workstation and System Operator permissions set-up, access groups, timezones, reports, maps, etc. shall be provided from any client workstation on the network. Initial setup of the cardholder screen layout shall occur on the database server. The SMS shall support the use of strong passwords.
7. Badge Layout Creation
   a. The SMS shall provide a Badge Layout Creation and Editing Module to allow for the creation of custom badge designs to be created by the CUSTOMER. The SMS shall support credit card, government, and custom credential sizes in

either a landscape or portrait format and shall support double sided and edge-toedge printing.

8. Screen or Forms Creation
    a. The SMS shall provide a Forms Designing and Editing Module that gives System Administrators the ability to modify any standard field to customize any or all of the cardholder, asset, or visitor forms. The SMS shall also allow System Administrators to add custom fields in addition to any standard fields on a minimum of 32 pages each of information for cardholder, visitor, and visit related data. User-defined fields absolutely shall not be pre-defined, meaning only the labels can change while the properties cannot. System Administrators shall have a minimum of 96 pages of which to design their cardholder, visitor, and visit screens with standard and custom fields.
9. Graphical Map Creation
    a. The SMS shall provide Graphical Map Creation and Editing Software that must allow System Administrators to import customized map backgrounds of their facility and to attach custom icons to those maps.
10. Application Programming Interfaces
    a. The SMS shall provide a set of standard Application Programming Interfaces (API's) and supporting documentation that allows hardware manufacturers and software application developers to integrate their products into the SMS. The Application Programming Interfaces shall allow requests from CUSTOMER to integrate a third- party hardware or software solution based on SMS open architecture and SMS device independence.
11. Data Import
    a. The SMS shall support an import utility that will allow the CUSTOMER or VAR to import cardholder information into the SMS database. This shall allow the CUSTOMER or VAR to pre-populate the SMS database with existing cardholder data and/or add new records to the existing SMS database.
12. Bi-Directional Data Exchange
    a. The SMS shall support a real time, bi-directional data interface to external databases such as Human Resources, Time and Attendance, Food Service Systems. The interface shall allow data to be imported into or exported out of the SMS in real-time or in a batch mode basis. Data used for import shall be retrieved directly from an external database or through an import file. Data provided for export shall be applied directly to an external database or through an export file. Any data shall be imported or exported including image data. The file used for import or created by export shall have the ability to be structured in a wide variety of ways, but shall always be in ASCII text format.
    b. The SMS shall also support a one step download and distribution process of cardholder and security information from the external database to the SMS database, all the way down to the Intelligent System Controller (ISC) database. This shall be a guaranteed process, even if the communication path between the SMS database server and the ISC is broken. If the communication path is broken, the data shall be stored in a temporary queue and shall be automatically downloaded once the communication path is restored.
13. API Development Toolkit

a. The SMS shall allow, through API toolkits, System Administrators to expose specific SMS data and events that are relevant to IT information or other thirdparty systems. Conversely, the SMS shall allow, through these same API toolkits, System Administrators to accept and process information exposed from the IT information or other third-party systems. This shall permit System Administrators to develop scripts and applications that allow events in either the IT domain to cause appropriate actions in the Security domain, and vice versa.

14. Server Redundancy
    a. The SMS shall support a fault tolerant server and redundant database architecture. The SMS shall also allow for a server clustering architecture. The SMS shall allow for normal operations to occur in the event that the Database Server fails. In the event of a server failure, the switch over to a backup server from a primary server shall be automatic and not impede the operation of the SMS.

B. SMS Software Functionality:
1. Timezones:
    a. The SMS shall be capable of creating and storing up to 255 timezones. Each timezone shall have a minimum of six (6) intervals. Each interval shall be assignable to any day of the week.
    b. Each timezone shall be assignable to an alphanumeric name of up to 64 characters. Timezones shall be applied to access levels, card reader modes, alarm inputs, alarm outputs, and alarm masking and logging functions. Timezones shall be allowed to belong to any or all access levels so that the timezone only has to be defined once.
2. Access Levels:
    a. Capable of defining a minimum of 32,000 access levels with a minimum of 128 access levels per cardholder per database segment. Access levels shall consist of a combination of card readers and timezones.
    b. Each access level shall be assignable to an alphanumeric name using up to 64 characters.
    c. Card readers shall have the ability to be assigned to any or all access levels defined in the SMS. Individual card readers shall be capable of having a distinct timezone assigned to it.
    d. Allow an ‘Allow User Commands’ option to be assigned on a per access level basis where keypad readers are in use.
    e. Allow a ‘First Card Unlock’ option to be assigned on a per access level basis.
3. Temporary Access Levels:
    a. Capable of assigning Temporary Access Levels inclusive of the 32,000 assignable Access Levels.
    b. Each Temporary Access Level shall be assignable to an alphanumeric name using up to 64 characters.
    c. Each Temporary Access Level shall be definable with a start and end date.

   d. Temporary Access Levels shall be stored in the ISC and functionality shall be maintained in the event of disconnection with the ISC.
4. Access Groups:
   a. The SMS shall be capable of assigning Access Groups with a maximum of 32 Access Levels per Access Group.
   b. Each Access Group shall be assignable to an alphanumeric name using up to 64 characters.
5. Precision Access Levels:
   a. The SMS shall be capable of assigning Precision Access Levels in addition to the 32,000 Access Levels with the ability to assign unlimited card reader and timezone combinations.
   b. Each Precision Access Level shall be assignable to an alphanumeric name using up to 64 characters.
6. Holidays:
   a. The SMS shall provide a minimum of 255 Holiday assignments using an embedded calendar. Holidays shall be assigned an alphanumeric name using up to 64 characters and shall be grouped into eight (8) types of holidays, and shall be assignable to individual timezones. Access rights, card reader modes, and alarm masking schedules must be able to be altered when the current date is designated a Holiday.
   b. Dates for Daylight Saving Time changes shall be definable and shall take effect automatically.
   c. The SMS shall support Holiday Ranges that allow a single holiday to span across multiple calendar days.
7. First Card Unlock: Feature that when configured retards a pre-determined timezone activated unlock command until a valid credential has been presented and granted access to the portal.
8. Database Segmentation: Support data segmentation whereby each segment shall have its own set of cardholders, field hardware and system parameters (timezones, access levels etc.). This segmentation shall expand the limitations of the SMS parameters (that is, access levels and timezones) to the maximum capacity of each parameter multiplied by the number of segments.
9. Field Hardware Communications:
   a. The SMS shall communicate with the ISCs by the following protocols: 1) RS-232
      2) RS-485
      3) TCP/IP
      4) Dialup via Modem
   b. Communication baud rate shall be system selectable with a range between 1,200 to 115,200 bits per second.
   c. Download communication between the SMS and the ISC shall be fully multi-tasking and shall not interfere with operational functions.
   d. Upon loss of communications between the SMS Server and the ISC an alarm shall be created with a time stamp. Upon re-established communication the SMS and the ISC shall automatically re-synchronize from the point of communication loss without operator intervention.
10. Multi-Drop Panel Support:

a. Support a multi-drop Intelligent System Controller architecture whereby up to eight (8) ISCs shall be multi-dropped on a single RS-485 communications line and whereby all eight panels communicate back to a single serial communications port.
b. The multi-drop panel support shall be used in conjunction with other ISC wiring support such as the star wiring configuration, home-run wire architecture, and advanced distributed network architecture.

11. Intelligent System Controller Remote Dialup Support:
    a. Support Remote Dialup operations to and from the Intelligent System Controller (ISC). The dialup connection shall be either a constant connection or a scheduled connection. If the connection is constant, then every panel shall have its own modem at the host. If the connection is scheduled, then all panels using remote dialup shall have the ability to share the same host modem(s).
    b. The LNL-2220 and LNL-3300 shall have native 10/100 Ethernet.
    c. System Administrators shall have the ability to define the modems available in the pool. For each modem, System Administrators shall be able to define the modem type and the client workstation that it is installed to.
    d. Dialup sessions shall occur under any of the user-defined scenarios:
        1) On Demand Connection: A System Operator shall have the ability to automatically initiate a dial in session to an ISC via the Alarm Monitoring application. 2) Scheduled Connection: System Administrators shall have the ability to configure the SMS so that the ISC dials into the SMS at a pre-determined times through use of timezones.
        3) Critical Alarm Activated: System Administrators shall have the ability to configure the SMS so that the ISC initiates a dialup session with the SMS when a critical alarm is activated in the field.
        4) Buffer Threshold: System Administrators shall have the ability to configure the SMS so that the ISC initiates a dialup session with the SMS when a pre-determined number of events are stored in the ISC memory buffer.
12. SMS to Intelligent System Controller Encryption
    a. Data security for encrypted connections between SMS and Intelligent System Controllers shall be provided by the full implementation of the Federal Information Processing Standard, FIPS-197, utilizing the 128-bit Advanced Encryption Standard (AES), also known as Rijandael, a symmetric encryption algorithm. The 128-bit AES encryption MUST be certified by the National Institute of Standards and Technology (NIST). FIPS-197 supersedes the aging Data Encryption Standard (DES) defined in FIPS-46-3. Implementation of FIPS-197 shall solve the data security requirements for open network connections by providing a means to secure the data over the non-secure network by encryption.
    b. The Intelligent System Controllers shall also support a 32-bit issue code. This shall only be used when implementing a Physical Access Control Systems (PACS) low and medium security profile enhancement.
13. Intelligent System Controller to Reader Interface and I/O Module Encryption
    a. Data security for encrypted connections between Intelligent System Controller and downstream modules (Reader interface and I/O Modules) shall be provided by utilizing the 128-bit Advanced Encryption Standard (AES), also known as Rijandael, a symmetric encryption algorithm.

b. The encryption between the ISC and downstream modules must support use of a diversified session key derived from a shared secret master key algorithm. The shared secret master key must be settable to insure uniqueness, and to authenticate connected modules prior to activating them for the session.

14. Area Control: Provide eight (8) area control features: Global Hard Anti-passback, Global Soft Anti-passback, Timed Anti-passback, Two Person Control, Designated One Person Control, Designated Two Person Control, Tail Gate Control, and Occupancy Limit. Area control shall be a security method of preventing a person from passing their badge to another person for dual entry into a single location utilizing one (1) card.
    a. The following summary criteria shall apply under Global Hard or Soft Anti-passback:
        1) Initially (Time 0) all cardholders are reset to Area 0.
        2) Any cardholder shall enter a controlled area any time after Time 0 by presenting a badge to a SMS entry card reader.
        3) A cardholder shall not exit the controlled area unless he or she has entered the area presenting a badge to the SMS entry card reader.
        4) A cardholder shall not enter the controlled area a second time unless the cardholder has exited that area previously.
        5) A cardholder shall be able to enter through any entry card reader and exit through any exit card reader of a single controlled area.
        6) These options shall include a “forgiveness” Administrator to reset the anti-passback of all cardholders to Time 0 Area 0, either through a manual override or a timezone command.
        7) The SMS shall provide an anti-passback exempt option for privileged or VIP (Very Important Person) cardholders. Cardholders with this option will not have anti-passback rules applied to them.
        8) The SMS shall also have a “forgiveness” feature that will allow the System Administrator to reset the anti-passback of an individual cardholder to Time 0 Area 0.
    b. Timed Anti-passback Feature: Permits the System Administrator to decide how long after a cardholder has swiped their badge that they will have to wait before the same badge will be accepted again at the same card reader. This helps prevent multiple swipes by an individual to allow access to others through turnstile doors.
    c. Two Person Control Feature: Provided to restrict access to certain areas unless there are two (2) cardholders present. This restricts individuals from being alone in restricted or highly secure areas. When an area is configured for Two Person Rule, the following criteria shall prevail:
        1) The card reader shall grant access only if two (2) valid cardholders (with authorized access levels) swipe their badges one after the other. In the event that a second authorized card is not presented within 10 seconds of the first authorized badge, the card reader shall reset and the first card will have to be swiped again. 2) Once two (2) people occupy an area, individual access shall be granted. 3) Individual exit shall be permitted until an area is occupied by only two (2) cardholders at which point the Two Person Rule applies for exit.
    d. Designated One Person Control: The SMS shall allow for a special One Person Mode. This mode shall require that a designated cardholder is present before anyone else is allowed to access a certain area. This restricts individuals from accessing a restricted or highly secure area when not accompanied by the designated cardholder. When an area

is configured for One Person Mode, the following criteria shall prevail: 1) The card reader shall grant access only if the designated cardholder (with authorized access level) swipes their badge.

2) Once the designated cardholder occupies an area, individual access shall be granted normally.

3) Individual exit shall be permitted until an area is occupied by only the designated cardholder, once the specific cardholder leaves, the area will again require the specific cardholder to be present before any other individual is allowed to gain access.

e. Designated Two Person Control: The SMS shall allow for a special Two Person Rule to restrict access to certain areas unless there are two (2) cardholders present and they are 78F<:A4G87 4 FC86<4? R-84@ &8@58ES 7<FG<A6G<BA. -;<F Eestricts individuals from being alone in restricted or highly secure areas as well as restricting the type of personnel allowed in a certain area. When an area is configured for the Designated Two Person Rule, the following criteria shall prevail:

1) The card reader shall grant access only if two valid cardholders (with authorized access levels and special Team Member distinction) swipe their badges one after the other. In the event that a second authorized card is not presented within 10 seconds of the first authorized badge, the card reader shall reset and the first card will have to be swiped again.

2) Once two (2) people occupy an area, individual access shall only be granted to other cardholders who have been designated the Team Member special distinction.

3) A Second designation, “Supervisor” can be assigned to other cardholders. Cardholders with the Supervisor designation shall be announced by means of a contact closure then their card is presented at the entry reader of the restricted area. The occupants of the restricted area may then choose to grant access to the supervisor by closing an external contact connected to the reader interface module, which will in turn energize the door strike output. Closing this contact at any other time shall not open the door.

4) Individual exits shall be permitted until an area is occupied by only two (2) cardholders with special Team Member distinction at which point the Designated Two Person Rule applies for exit.

g. Occupancy Limit Feature: Restricts the number of cardholders that shall be present in an area at any given time. The Occupancy Limit area shall be able to be defined by the System Administrator to limit up to 65,000 cardholders to be in that area at any given time. Once the occupancy limit has been reached, a cardholder must swipe out of the exit card reader before the next cardholder may enter. Each area for which Occupancy Limit is enabled shall be definable with up to 64 entry or exit card readers. Multiple Occupancy Limit Areas shall be definable.

15. Interlock group readers
16. The SMS shall have Interlock support. In the Anti-passback area, there shall be an option to make an area an interlock area. Interlocked areas shall be able to be configured, allowing only one door to be opened at a time within the area. This function shall only be able to be enabled for local anti-passback and shall be unavailable for global anti-passback.
17. The SMS shall support interlocking group readers. As soon as one door's strike is energized or door is open in the group, all other doors will be denied access until a condition is met.

When the SMS USER creates an area with the Interlock set, when one door strike of the area is active or if the door is open, then no door shall be allowed to open and there shall be an alarm.

18. There shall be an alarm for when access is denied due to interlock reader group. There shall be the alarm, "interlock Area Busy," that shall show up when trying to get access from a card. There shall be the alarm, "Exit Request Denied: Interlock Area Busy," that shall show up when pressing the REX button on the panel. There shall be the alarm, "Cannot Open Door: Interlock Area Busy," that shall show up when opening a door from the SMS's Alarm Monitoring application. All alarms shall have a priority of 100 in the SMS's System Administration application.
19. Field Hardware Configuration: All field hardware configuration windows shall be accessed from either the SMS Icon Toolbar or from menu options in the menu bar within the SMS configuration module of the software. When a field hardware device is configured, the device shall appear in the graphical system overview tree and in all appropriate forms.
    a. Configuration of Intelligent System Controllers (ISCs), Input Control Modules (ICMs), Output Control Modules (OCMs), and card readers shall be provided in a Windows format and shall include the following features:
    b. A tab format to logically group information into a series of forms within an icon or menu option. This shall allow for ease of configuration. For example, all forms that relate to the configuration of card readers shall be grouped together in the 'Card reader' icon.
    c. Drop-down lists to define features
    d. Check boxes
    e. Spin buttons
    f. Browse Buttons for ease of locating client workstations
    g. Sortable Lists
    h. Graphical System Overview Tree controls for ease of navigation and use
    i. The SMS shall have the ability for bulk add, modify, and delete privileges for ISCs and card readers to allow for the ease of addition and maintenance of these field hardware devices.
20. The SMS shall provide the ability to search large lists of devices for a string or substring in the device name.
21. Alarm Masking Groups: Support a group alarm masking feature whereas System Administrators shall be able to create groups of alarm inputs that enable them to mask or unmask multiple Input Control Module inputs and card reader inputs simultaneously. The following events shall have the ability to be part of an alarm masking group:
    a. Input Control Module Events
        1) Alarm Input Active
    b. Card Reader Events

1) Auxiliary Input Active
    2) Denied Count Exceeded
    3) Door Contact Tamper
    4) Door Forced Open
    5) Door Held Open
    6) Card Reader Input Tamper

c. Alarm Masking Groups shall be able to be masked as a group or as individual points.

d. Alarm Masking Groups must support the ability to be masked multiple times. Alarm Masking Groups shall be able to be masked and/or unmasked via alarm monitoring commands by guards, via card reader keypad function keys, or via global linkage commands.
e. The SMS shall support "Two Man Control" for masking Alarm Masking Groups.
f. The SMS shall support an Alarm Masking Group status change (Masked to Unmasked or Unmasked to Masked) action to be linked to a function list that is capable of performing many system actions, such as activating a relay output. The SMS shall support a minimum of 64 Alarm Masking Groups per Intelligent System Controller with a minimum of 200 alarm inputs per Alarm Masking Group.

22. Global Input or Output or Event Linkage:
    a. Support a global linkage feature whereby any input or output or event shall be linked to any other input or output or event in the SMS. Input or Output Linkages shall be able to span across Intelligent System Controllers.
    b. System Administrators shall be able to create global I/O function lists, each consisting of a sequence of actions to be performed, such as changing card reader modes, activating outputs, and opening or closing anti-passback areas. Each function list may include up to six (6) actions.
23. Cardholder Use Limits: Support a Cardholder Use Limit feature that shall allow System Administrators to specify the maximum number of times that a cardholder may use their credential at card readers in the SMS.
24. Extended Individual Door Held Open Times: The SMS shall support Extended Individual Door Held Open Times that allows a card reader's door to be held open for an extended period of time beyond the pre-determined standard held open time on a per cardholder basis. The extended held open time shall be user-definable up to 131,070 seconds. Extended held open times shall be set on a card reader by card reader basis.
25. Extended, on Demand, Door Held Open Times:
    a. Support extended, on demand, door held times via a command keypad. The Extended Held Open command configuration shall consist of a command key sequence that shall be from 3 to 6 keys used to enter the number of minutes to extend the door held open time (up to 999 minutes) and a pre alarm time (from 0 to 30 minutes).
    b. Only those cardholders having Command Authority at a given card reader configured for 'Allow User Commands' shall have the ability to execute the Extended Held Open command at that card reader. The Extended Held Open command shall be available after a valid cardholder has received an Access Grant at the card reader. The cardholder shall have a period of fifteen seconds after the Access Grant to enter the extended held open command sequence.

26. Graphical System Overview Tree: Displays a graphical representation of all field hardware (including ISCs, fire panels, intrusion detection devices, personal safety devices, intercom systems, and central station alarm receivers), digital video hardware, access levels, timezones, access groups, holidays, and card formats that have been configured in the SMS. System Administrators shall be able to modify a device that is depicted on the graphical system overview tree or see its properties by double-clicking on the icon and the SMS shall bring them to the appropriate form.

27. Pre-Alarm: The SMS shall support a pre-alarm feature at the card reader. The pre-alarm will sound a tone at the card reader prior to the door held open alarm. The pre-alarm setting shall be configurable for up to a maximum of 131,070 seconds (2,184.5 minutes or 36.4 hours).
28. Alarm or Event Logging:
    a. All alarms and events in the SMS shall by default, always be recorded in the database. The SMS shall give System Administrators the ability to select on a timezone basis, the times that they require the SMS to log specific events to the database.
    b. System Administrators shall have the option for Alarm or Events to be set to log or not to log particular alarms or events on any individual reader and or input.
29. Scheduling Utility:
    a. An integral Scheduling Utility shall be provided. The Scheduling Utility shall allow System Administrators to schedule actions to occur on a one-time or a recurring basis. Recurring schedules shall be configured to begin immediately, last indefinitely, or have optional start and end dates.
    b. The Scheduling Utility shall be available from both the System Administration and Alarm Monitoring applications.
    c. The types of actions that shall be schedulable include but are not limited to:
        1) Action Group
        2) Event Archiving or Purging
        3) Arm or Disarm Area
        4) Start of Guard Tour
        5) Execution of Data Exchange Scripts
        6) Activate, Deactivate, Pulse Device Output and Device Output Groups
        7) Global Anti-Passback Reset
        8) Download Firmware to ISCs and IP Cameras
        9) Download Firmware to Lenel Network Video Recorders (LNVR)
        10) Download Database to ISCs
        11) Execute Function List
        12) Mask or Unmask Inputs, Input Groups, Alarm Mask Groups, Door Forced Open or Held Open
        13) Open Door, Open Door Group
        14) Change Reader Mode
        15) Automatic Reports
        16) Reset Use Limit
        17) Move Bulk Badges from an Area
        18) Deactivate Badges
        19) Logout Visitors
        20) Schedule PTZ Presets
    d. The Scheduling Utility shall maintain a history log in the database for actions that it executes.
30. Multiple Card Formats: Support an unlimited number of card formats. Magnetic stripe and Wiegand card formats shall be supported. Each ISC shall support a minimum of eight (8) access control card formats and if applicable, eight (8) asset formats. As such, each card reader shall also be able to support a minimum of eight (8) access control card formats. If applicable, asset readers shall be able to support a minimum of eight (8) access control card formats and eight (8) asset management card formats. The SMS shall support any magnetic

stripe format that uses card number, facility code, and issue code combinations with a maximum of a nine digit card number and two digit issue code. The SMS shall support any industry standard Wiegand card format.

31. Card Reader Cipher Mode: Support a card reader Cipher Mode that shall allow authorized cardholders to enter their Badge ID by typing it into a card reader keypad, thus emulating the presentation of the credential to the card reader.
32. Denied Access Attempts Counter: Support a denied access attempts count on a per card reader basis. The "Denied Attempts Count" value shall be configurable from 0 to 255. The following access denial types shall cause the current denied count to be incremented: a. Unknown PIN entry at a card reader configures as 'PIN or Card' mode
    b. Invalid cipher entry at a card reader in Cipher Mode
    c. Invalid PIN entered for a given card at a card reader configured 'Card and PIN' mode
    d. Non-matching biometric presented for a given card at a card reader in biometric verify mode.
33. Card Reader Timezone Overrides:
    a. Allow for the pre-defined default card reader settings to be overridden or temporarily changed on a timezone basis. At the beginning of a selected timezone, the selected card reader's operational mode shall be modified from its default mode to any one of the following modes: locked, unlocked, facility code, card only, card or PIN, card and PIN, card and Biometric, card or PIN and biometric, and/or card and PIN and biometric. The aforementioned options shall be available depending on the type of card reader utilized.
    b. Each card reader shall have the ability to have multiple timezone setting overrides assigned to them as required by the System Administrator.
34. Online Context-Sensitive Help: Provide online context-sensitive help files to guide System Administrators and System Operators in the configuration and operation of the SMS. The help menu shall be available from any window in the SMS by pressing the F1 function key or clicking on the Help icon in the toolbar. Help windows shall be context-sensitive so System Administrators can move from form to form without leaving the help window. The SMS shall also come with complete online documentation on the product disc.
35. Monitor Zones:
    a. The SMS shall provide System Administrators the ability to segment their access control SMS field hardware devices into various zones or areas where alarm monitoring client workstations will monitor. These zones shall be assigned an alphanumeric name using up to 128 characters.
    b. The SMS shall allow subset relationship devices (such as card readers or ICMs to Intelligent System Controllers) to be automatically part of the monitoring zone when an ISC is selected AND it shall allow the System Administrator to define which subset devices (card readers, ICMs, etc.) belong to that monitor zone.
    c. Updating of monitor zones shall take place in real time and without requiring operators to re-login.
36. Advanced Field Device Control: The SMS shall allow a System Operator to monitor all alarms in their assigned monitor zone, but only be capable of performing field device control actions on specified devices in the assigned monitor zone. The SMS shall allow System Administrators to set permission control for individual devices within a monitoring zone for command override. The list of permissions for control under the monitor permission groups shall include the following: a. Access modes

b. Open doors
c. Relay and reader outputs
d. Set panel clock
e. Mask alarms and inputs
f. Unmask alarms and inputs
g. Mask alarm mask groups
h. Unmask alarm mask groups

i. Execute function lists
j. Paging
k. E-mail
l. Panel dialup
m. Standalone test mode
n. Download firmware
o. Arm areas
p. Disarm areas
q. Silence area alarms

37. Alarm or Event Routing:
    a. The SMS shall be capable of allowing System Administrators to route alarms and events to various alarm monitoring client workstations on the network. The SMS shall allow any alarm or event to be routed to one or multiple client workstations on the network regardless of where the alarm is generated in the field. Alarms shall be routed to client workstations on a device by device level.
    b. The SMS shall be capable of automatic re-routing of an alarm from workstation X to workstation Y if the alarm is not responded to within a user-definable time period.
    c. The SMS shall implement network synchronization that in the event alarm or event is routed to multiple client workstations, once the first client workstation 'grabs' the alarm, the alarm or event shall be cleared from all other client workstations. As such, alarms that are routed to an alarm monitoring client workstation which does not have a System Operator logged in shall be queued so that all unacknowledged alarms will report to that client workstation once a System Operator has logged into the SMS. Alarms or Events shall be routed based on default settings or timezone control.
38. Text Instructions: Allow for a set of text instructions to be associated with each alarm that arrives into the SMS. The text instruction function shall allow the System Administrator to enter a minimum of 32,000 characters of text for procedures to follow for each alarm that arrives at the alarm monitoring client workstations. Each alarm or event in the SMS shall have its own unique set of text instructions should the System Administrator desire. 39. Alarm Attributes: The System Administrator shall have the ability to configure how the SMS handles the annunciation of alarms on an individual basis. Each alarm and/or event shall have the option(s) to:
    a. Display at one or more alarm monitoring client workstation.
    b. Allow higher priority alarms to be displayed on the alarm monitoring client workstation ahead of lower priority alarms.
    c. Require the field device, which generated the alarm to be restored to its normal state before the alarm is cleared.
    d. Print the alarm to the local event printer.
    e. Have a customized voice message annunciate at the client workstation.

f. Have the alarm breakthrough to the alarm monitoring window should the System Operator be working in another application.
g. Allow System Operators to change the journal entry once the alarm has been acknowledged.
h. Insure that the alarm will not be able to be deleted from the alarm monitoring window upon acknowledgment.
i. Display text and audio instructions outlining the procedures to follow when responding to the alarm.
j. Automatically call-up associated maps.
k. Automatically call up the associated cardholder record.
l. Automatically call up the associated cardholder photo using the video verification function.
m. Require a password to view the alarm.
n. Require a password to acknowledge the alarm.
o. Require acknowledgment to clear.
p. Allow mandatory journal entry upon acknowledgment.
q. Use pre-defined journal entries for alarms.
r. Select the option for journal entry based upon the specific alarm.
s. Automatically send an e-mail message.
t. Automatically send an alphanumeric page.
u. Have the alarm appear on the alarm monitoring window with a flashing colored coded bar across the alarm for high priority alarms.
v. Have the alarm, when acknowledged, display an alternative flashing color coded bar across the alarm than for the original alarm color.
w. Trigger a function list(s) when the alarm is acknowledged. x. Require User Logon for Acknowledgment

40. Alarm-Event Mappings: The SMS attributes in Alarm Attributes shall be assignable on a 'global' basis to all devices that share an alarm description. Thus, the 'door force open' alarm attributes shall apply to any door with a card reader that is forced opened in the SMS. The SMS shall have the capability to assign a unique group of alarm attributes to specific device or alarm combinations to override the global settings for specific case settings. For example, System Administrators may assign a different set of attributes to be applied to a 'door force open' at a bank vault or research facility than they would if the front door was forced open. The SMS must include this type of flexibility. Each device or alarm combination shall have the ability to have its own unique attribute set if the System Administrator desires.
41. System Downloads:

a. The SMS shall provide for the downloading of data to the ISCs. Downloads shall load SMS information (timezones, access levels, alarm configurations, etc.) into the ISCs first, followed by cardholder information and card reader configurations.
b. All ISCs on the SMS shall be capable of either full or selective downloads to individual Intelligent System Controllers and bi-directionally so that alarms will still report to their respective alarm monitoring client workstations as cardholder information is being downloaded.
c. A complete database download of 10,000 cardholder records to all ISCs (regardless of the number of ISCs) must be complete within ten (10) minutes.

d. Information on cardholder status, badge status, timezones or access levels shall download in real time as they are added, modified, or deleted from the SMS.

42. Card Reader Options: Include the following options for each reader on the system:

a. Allow User Commands
b. Rename Auxiliary Inputs
c. Rename Auxiliary Outputs
d. Independently Supervise REX and DPS
e. Configure REX and DPS as Normally Open or Normally Closed
f. Deny if Duress
g. Assume Door Used h. Alarm Masking
i. Activate Outputs
j. Two Card Control
k. Checkpoint
l. Do Not Activate Strike on REX
m. The ability to allow System Administrators to determine on a timezone basis to log or not to log on a card reader by card reader basis:
    1) Access Grants
    2) Access Denied
    3) Card Reader Status Alarms.
n. Allow for user-definable door strike functionality for each card reader in the SMS.
o. Allow for each card readed to be selected as either an ‘in’ reader, ‘out’ reader, or ‘none’ to allow for ease of reporting time and attendance basic ‘time in’ and ‘time out’ data.
p. Enforce Use Limit: This option shall enable Card Use Limits at the card reader limiting the number of times that cardholders may use their credential to gain access at the card reader.
q. Alarm Shunt: The SMS shall have the ability to shunt a door contact of separate intrusion detection systems. When the SMS provides an access granted a dedicated auxiliary output shall first trigger and bypass the door contact of the separate intrusion detection system, and then the door locking mechanism shall unlock. Once the door returns to a secure state the door contact of the separate intrusion detection system shall return to its normal state.
r. Supervise Door: Sets the SMS so that the card reader door contact is wired as a supervised input.
s. Relaxed door forced open detection: The SMS shall provide an option that when selected shall allow for the door to be opened for an additional three (3) seconds time period after the request-to-exit sensor has been returned to the normal state.
t. Allow for one (1) or more access points in a specified area to be armed and disarmed directly from the Command Control Keypad.

43. Input Control Module (ICM) Options: Provide the following options for the Input Control Modules:

a. Alarm Masking: The ability to mask the alarm input on a timezone basis.
b. Local Linkage: The ability to locally link outputs with inputs that are attached to the same ICM or Output Control Module (OCM).
c. Activate Output: The ability to activate an output tied to the ICM or OCM on a timezone basis.
d. Activate Output Always: The ability to activate an output always.

e. Configuration of Debounce Times: The ability to control the amount of time that an input state change must remain consistent in order for it to be considered a real change of state.
f. Configuration of Hold Times: When configuring an Alarm Input, a hold time setting shall be settable from 0-15 seconds.
g. Checkpoint: The ability to configure an input as a designated stop on one or more guard tours.
h. Supervised Input: The ability to specify if a specific alarm contact on the ICM is a supervised or unsupervised contact.

44. Entry or Exit Delay: The ability to set up entry or exit delays for inputs that are attached to any ICM, SRI, or DRI. System Administrators shall have three options for entry or exit delay:

a. Non-Latched Entry: When an input activates, the alarm will not be reported until the Entry delay expires. If the input is still active when the entry delay expires, the alarm will be reported. If the input is not active when the entry delay expires, then the alarm will not report.
b. Latched Entry: When an input activates, the alarm will not be reported until the Entry delay expires. If the input is still active when the entry delay expires AND the alarm has NOT BEEN MASKED, the alarm will be reported. If the input has been masked when the entry delay expires, then the alarm will not report.
c. Exit Delay: When an input activates, the alarm will not be reported (operates as if masked) until the Exit delay expires. If the input is still active when the exit delay expires, the alarm will be reported. If the input is not active when the exit delay expires, the alarm will not be reported.

45. Intelligent System Controller Options: System Administrators shall have the ability to group add, modify, and delete Intelligent System Controllers (ISCs) in the SMS. The SMS shall have a copy command, allowing System Administrators to easily and efficiently add ISCs. The copy command will copy all information configured for an ISC selected and apply those same characteristics to the new ISC being added. System Administrators shall apply those same characteristics to the new ISC being added. System Administrators shall also have the ability mark ISCs as ‘online’ or ‘offline’ depending on whether those panels are online. The SMS shall also prompt the System Administrator if the System Administrator attempts to configure the number of cardholders (and assets, if applicable) that will be downloaded to an ISC to a number greater than that which the ISC’s memory can handle.
46. Strike Follower
47. An output for a reader can be overridden so that it is configured to activate and deactivate timed with a door strike. It can be set for a delay time and/or pulse.
48. There shall be a mode called "Strike Follower". The mode shall be optional and mutually exclusive with alarm shunt and tailgate. Strike Follower shall override the auxiliary 1 output and shall allow the output to follow the strike pulse. It shall be configurable with a delay and a pulse time.
49. The settings shall include:

a. Activation delay
b. Mode: Pulse or Follower
c. Pulse time: When pulse is used, a pulse time can be specified.

50. Alarm Monitoring - Alarms Monitored: When the SMS is configured, the System Administrator shall assign a default monitor zone to be monitored. The monitor zone shall include default alarm types with default timezones of which the alarm type will be monitored. These monitor zones will then be assigned to an alarm monitoring client workstation. The SMS shall allow for the monitoring of a combination of one or more ISCs, ICMs, alarm inputs, alarm outputs, and card readers. If applicable, the SMS shall also allow the monitoring of a combination of digital video recorders, video cameras, fire alarm panels, intrusion detection devices, central station alarm receivers, intercom exchanges, intercom stations, and personal safety panels. System Administrators shall have the option to define monitor zones to include all sub devices of an ISC and/or digital video recorders or to choose which sub devices of an ISC and/or digital video recorder belong to that monitor zone. Alarm monitoring client workstations shall be configured to annunciate any or all of the following types of alarms: access granted alarms, access denied alarms, system alarms, emergency alarms, and/or area control alarms.
51. The SMS shall allow for automatic update of the list of hardware devices as they are added, modified or deleted from the SMS. Newly configured devices and changes to existing devices shall be reflected in the hardware list automatically. The SMS shall indicate a deleted device by changing the icon and text associated with the device. Upon the next login, the SMS shall remove the device from the hardware tree.
52. Alarm Annunciation Configuration: The System Administrator shall have the capability to configure how the SMS handles the annunciation of alarms on an individual alarm or event basis. Each alarm and/or event shall have the option(s) to: a. Display on the alarm monitoring client workstation.
    b. Allow higher priority alarms to be displayed on the alarm monitoring client workstation ahead of lower priority alarms.
    c. Require the field device that generated the alarm to be restored to its normal state before the alarm shall be cleared from the alarm monitoring window.
    d. Print the alarm to the local event printer.
    e. Have a customized voice message annunciate at the client workstation.
    f. Have the alarm breakthrough to the alarm monitoring window should the System Operator be working on another application on the alarm monitoring client workstation.
    g. Allow System Operators to change the journal entry once the alarm has been acknowledged.
    h. Require that the alarm not be deleted from the alarm monitoring window upon acknowledgment.
    i. Display text and audio instructions outlining the procedures to follow when responding to the alarm.
    j. Automatically call-up associated maps upon arrival.
    k. Automatically call up the associated cardholder record with photo when the alarm displays.
    l. Automatically call up the associated cardholder photo in the video verification function when the alarm displays for comparison to a live video image at the card reader.
    m. Automatically call up live video from a digital CCTV camera to view the area in alarm
    n. Allow the System Operator to control digital CCTV camera functions including pan, tilt, zoom, focus, and iris controls.
    o. Require System Operators to enter in a password to view the alarm.
    p. Require System Operators to enter in a password to acknowledge the alarm.

q. Require System Operator acknowledgment to clear.
r. Allow mandatory journal entry upon acknowledgment.
s. Have pre-defined "canned" journal entries for alarms in the SMS.
t. Allow non-essential events to be cleared without requiring System Operator journal entry, while other alarms shall require System Operator journal entry.
u. Automatically send an e-mail message to one or more e-mail recipients.
v. Automatically send an alphanumeric page to one or more pagers.
w. Have the alarm appear on the alarm monitoring window with a flashing colored bar across it for high priority alarms based on its priority. Each priority in the SMS shall have its own unique color assigned to it. A minimum of 255 colors must be available for assignment to a minimum of 255 priority levels.
x. Have the alarm, when acknowledged, display a different flashing colored bar across the alarm than for the original alarm color. Each acknowledged priority in the SMS shall have its own unique color assigned to it. A minimum of 255 colors must be available for assignment to a minimum of 255 priority levels.
y. Insert and display alarms based on sort order. System Operators can sort on alarms based on alarm priority, time, date, alarm description, card reader, alarm input device, ISC, cardholder, and if applicable, asset scan ID, asset name, intercom station, central station alarm receiver, transmitter, or transmitter input. All sorts MUST be able to be accomplished in one mouse click.
z. Allow the System Operator to be able to find the location of the alarm by using a graphical map, the real-time graphical system status tree, or an alarm menu. A map callup feature must be provided that will show the map associated with the alarm. aa. Have a function list(s) assigned to it that will trigger when the alarm is acknowledged.
bb. Require User Logon for Acknowledgment P This feature shall require a user ID and password to be entered when the given alarm is acknowledged. This ID shall be different than the User ID that is currently logged onto the SMS.
cc. Activate an Action Group P This feature shall allow the System Operator to execute an action group, which shall include one or more actions.

53. Alarm Handling: The handling of alarms shall resemble the following steps.

a. The System Operator shall select the alarm or event by any one of the following procedures:
    1) Clicking with the mouse on the system device map icon representing the alarm
    2) Choosing acknowledge from the menu bar
    3) Highlighting the alarm or event in the alarm list by clicking the mouse
    4) Double-clicking on the alarm or event in the alarm list box
b. Any of the above choices shall put the System Operator in the acknowledgment window. The acknowledgment window shall display the time, date, and a user-defined description of the alarm, as well as any emergency procedures. The acknowledgment window shall present the System Operator with the following choices:
    1) Review instructions or procedures to follow for the alarm
    2) Make a journal entry
    3) Acknowledge the alarm
    4) Listen to audio instructions
    5) Print the alarm and instructions to a local printer
    6) Review any previous journal entries for this alarm.

54. Until the alarm is acknowledged, the alarm shall remain in the Main Alarm Monitoring Window and be counted in the alarm status line.
55. System Operators shall have the ability to mark an alarm as 'In Progress', meaning that a System Operator has recognized the alarm and is working on a response. When an alarm is marked as 'In Progress', the SMS shall silence any repeating audio notifications on any Alarm Monitoring Workstation in which the alarm was routed and also remove the alarm sprite notification on any graphical maps that may be displaying the alarm. Other System Operators shall be notified that an alarm has been marked as 'In Progress' by an icon next to the alarm in the Main Alarm Monitoring Window.
56. Control of the associated field hardware device from which the alarm was generated through a right-mouse click operation shall be available. For example, a System Operator can open a door via a card reader alarm. All field hardware device icons on any screen can control the associated field hardware through a right-mouse click operation. A right-mouse click will invoke a menu item with all available control options for that hardware device.
57. System Operators shall have the ability to delete the alarm from the alarm monitoring window without acknowledging the alarm. This feature is useful when guards are monitoring access grants to track where cardholders are moving throughout the facility, but do not necessarily want to acknowledge the alarm.
58. The SMS shall provide a text entry field for the System Operator to enter a journal detailing the cause of specified alarms and the actions taken. The journal shall be mandatory for certain alarms or events per the System AdministratBEUF 7<F6E8G<BA. -;8 journal shall allow System Operators to enter an unlimited amount of notes. Choosing Acknowledge from this window shall clear the alarm indicator and store the alarm information and journal to the database.
59. Other alarms shall be displayed by the SMS while any alarm is being addressed. If another alarm occurs, the alarm pending counter shall increase by one and the new alarm shall enter into the alarm list box prioritized in a sort order as defined by the System Operator. Up to 255 alarm priorities shall be available.
60. The SMS shall allow journals to be retrieved, viewed, and edited on screen to provide the System Operator with the ability to complete unfinished journal entries. Journals shall be saved to the database and to a tape during database backups for a permanent record as required by CUSTOMER regulations.
61. For card reader alarms, the SMS shall allow System Operators to activate, deactivate, or pulse any or all of the card reader outputs configured and associated with the card reader. The System Operators shall also have the ability to mask or unmask each individual card reader door forced open alarms, door held open alarms, and either or both or the auxiliary alarm inputs configured and associated with the card reader.
62. Current Status Indication: The alarm monitoring window shall provide a visual status that displays the current status of all devices in the device tree including child devices downstream from the primary device. Additionally there shall be a numeric display of card readers, ISCs and ICMs that are offline.
63. Pending Alarm Windows: The SMS shall support a Pending Alarm Window in the Alarm Monitoring Workstation. This shall be a separate window from the Main Alarm Monitoring Window that shall be opened at any time to view a list of only pending alarms. The Pending Alarm Window shall be optionally displayed in conjunction with the Main Alarm Monitoring Window. The Pending Alarm Window shall continuously update as new pending alarms are generated and as existing pending alarms are acknowledged or deleted.

Pending alarms shall also display in the Main Alarm Monitoring Window. The Pending Alarm Window shall operate and function in the same manner as the Main Alarm Monitoring Window described throughout this document.

64. Device Group Support: Support device grouping for uniform command and control of groups of devices within the system. Four types of homogeneous device groups shall be supported:
a. Card Reader Groups
b. Input Groups
c. Relay Output Groups
65. Color Coding for Alarm Priorities: Display alarms in the active alarm monitoring window with a flashing colored bar across the alarm based upon priority. Acknowledged alarms may be set with alternate color-coding. A minimum of 255 colors must be available for assignment to a minimum of 255 priority levels.
66. Highlighting of Unacknowledged Alarms: The SMS shall allow for unacknowledged alarms to automatically be displayed in a pop-up window after a user-defined amount of time. The user-defined amount of time shall be set in System Administration.
67. Pre-Defined “Canned” Alarm Acknowledgement Responses: Have the capability for pre-defined alarm acknowledgment responses for alarms in the SMS. An unlimited number of pre-defined responses shall be able to be configured for each alarm in the SMS.
68. Cardholder Record Call-up: From the alarm monitoring window, the System Operator must be able to display a cardholder record with the stored cardholder’s image This feature shall be user configurable to be automatic meaning that the Cardholder Window will automatically appear on the Alarm Monitoring client workstation on cardholder activity and will display the current cardholder’s information with photo. The Cardholder Window will automatically update with updated cardholder information as additional cardholder activity is generated. This feature shall be provided at all alarm monitoring client workstations to assist the System Operator in determining the access rights of an employee who may have forgotten his or her badge or to verify that the individual presenting the card is the correct individual cardholder. Utilizing a database search via the input of the cardholder's name or other key search field, or by selecting a cardholder record call-up from the main monitoring window on a cardholder alarm, the SMS must access the employee's personnel file, containing pertinent information and the employee's image for identification by the System Operator. The System Operator shall not be required to exit alarm monitoring to view this information and this operation must not restrict the operation of monitoring alarms.
69. In the event of an access denied or access granted card reader alarm signal to the alarm monitoring client workstation, this function shall be available as a menu or mouse selection, based on the alarm event. Data input by the System Operator shall not be required. 70. Inactive Badge Alarm: The SMS shall provide an alarm, indicating current badge status, if An attempt to gain access is made with a badge that’s status is set to any other value other than “Active” in the card holder record. Typical inactive badge status values include “Lost” and “Terminated”. Access shall come with this feature disabled, the System Administrator has the ability to enable this functionality.
71. Request to Exit Event: The SMS shall provide an event when a Request to Exit (REX) is used. By default, the SMS shall come with this feature disabled, the System Administrator has the ability to enable this on a reader by reader basis.

72. Cardholder Photo Verification: From the alarm monitoring window, the SMS shall optionally display the stored cardholder photo for each credential presented at the user specified reader(s). This function shall allow an operator to verify that the person using the credential matches the stored photo. The system operator shall be able to select from a list of readers. As the cardholder badges through the selected reader their photo shall appear in the Cardholder Verification window. The system operator shall be able to open multiple Cardholder Verification windows to cover multiple readers at the same time. If the Cardholder Verification window is open when the Alarm Monitoring application is closed then the Cardholder Verification window shall open automatically next time the application is launched.
73. Cardholder, Card Reader, or any Field Hardware Device Trace: From the alarm monitoring window, the System Operator must be able to initiate several traces of cardholders, assets, and/or field hardware devices while monitoring alarms. This information shall be continuously accumulated in the dedicated trace window until the trace is stopped. The trace operations must not interfere with the operation of the alarm monitoring, and be continuous while alarms are monitored. The results of each trace shall be printable on the report printer or displayed on the screen. The traces shall operate independently, such that one trace may stop and start without interfering with another.
74. Trace windows operate independently of each other and the Main Alarm Monitoring Window. Thus, different Alarm Filter sets shall be settable for each alarm window (Main Window and Trace Windows) open in Alarm Monitoring. For example, the Main Alarm Monitoring Window may not monitor Access Grants Events, while one or more of the trace windows are monitoring Access Grants Events.
75. The operator of the SMSUF A?4E@ &onitoring application shall be able to acknowledge alarms from any alarm view window (even if they are no longer present in the Main Alarm Window). The alarm view windows shall include Main Alarm Monitor, Trace Monitors, Pending Alarms, and Video Verification. The SMS shall allow for individual alarm acknowledgement and fast or group acknowledgement.
76. The SMS shall support historical traces. Historical traces shall allow System Operators to specify the date and time range that they would like displayed for the particular device that is being traced. For example, a System Operator may perform a historical trace that shows the last seven days activity at a particular card reader. Events are then added in real-time during and after the database has been searched for historical events. Historical traces shall also have the ability to be run against restored (previously archived) data.
77. The SMS shall allow System Operators to filter alarm types from the history trace window. Alarms that shall be filtered from the trace window are access granted alarms, access denied alarms, system alarms, duress alarms, and area control alarms. If applicable, alarms that shall also be filtered are asset alarms, fire alarms, intercom alarms, central station receiver alarms, video clips, and transmitter alarms.
78. The SMS shall allow for a trace on any ISC, ICM, Alarm Input, Credential, Intrusion Detection Device, Monitor Zone, or card reader to be performed. If applicable, the SMS shall allow for a trace on any asset, intercom, or camera to be performed.
79. Single-Click or Double-Click Device Command Execution: The SMS shall support the ability to execute a device command based on either a single-click or double-click on the field device icon in the System Hardware Status Tree or Graphical Map. For example, double-clicking a card reader icon shall pulse open the door for the configured strike time.

Whether a single-click or double-click is used to activate the command shall be determined on a System Operator basis.

80. 'On the Fly' New Login of System Operators: Allow a System Operator to login over another System Operator who is already logged into the same client workstation. This process shall log the first System Operator off of alarm monitoring and log the new System Operator on, changing any permissions necessary for that System Operator.
81. Auto Exit to Windows 7 or 2008 or 2003 or XP or Vista Login Window: Configurable to automatically exit the Alarm Monitoring application and log the System Operator out of the Windows 7 or 2008 or 2003 or XP or Vista Operating System when a System Operator logs off an alarm monitoring client workstation. The SMS shall then bring the System Operator to the Windows Login Window for the next System Operator to log on.
82. Grant or Deny Popup Window: The SMS shall have the ability to launch a pop-up window when a request for access is made through global input or output activity, such as when an intercom station is linked to a door. Upon activating the intercom, the pop-up window shall be displayed in the Main Alarm Monitoring Window and the System Operator shall then have the ability to issue a grant or a deny for the open door request.
83. Alarm Monitoring P Column Display and Configuration: Allow System Administrators and System Operators to define which columns are displayed in the Main Alarm Monitoring Window and in which order. System Administrators and System Operators shall also be able to determine the column order.
84. Test Mode: Support a Test Mode for Alarm Inputs, Door Forced Open, Access Grants. Tests on Input Device Groups shall be available to verify that all inputs within the group are operational. Upon entering into Test Mode and for the duration of the test, alarms from members of the group shall either be displayed in a separate window or view on test alarm monitoring client workstations or on all Alarm Monitoring client workstations in which the alarms are usually routed. During the test (the duration of the test shall be set by the System Operator), all inputs within the group are manually activated in the field. At the end of the time duration, a report shall be generated flagging any inputs for alarms that were not received. During the Test Mode, all alarm operations carry on as programmed (that is, Global I/O functions, CCTV commands, printer activity, etc.) so that all functions are tested.
85. Manual Control: Provide the System Operator the option to manually control over all output points or input points connected to the SMS. Control points are defined as any door strike, auxiliary card reader output, or any other relay output point of an Output Control Module (OCM).
86. Destination Assurance: Provide the ability to alert the system operator when a cardholder does not reach a required location and present their credential after entering at a designated checkpoint in a designated period of time.
87. Real-Time, Dynamic Graphical Maps:
    a. Support graphical maps that display device or group status, function lists and video cameras dynamically in real-time. The maps may be configured to appear on command or when specified alarms are selected for acknowledgment. Map device icons shall have the ability to dynamically change shape and/or color to reflect the current state of the device. The SMS shall indicate if the field hardware is not operating with the most current version of firmware.
    b. Support all map formats listed below:
        1) Adobe Photoshop (.psd)

2) AutoCAD DXF (.dxf)
3) CALS Raster (.cal)
4) Encapsulated Post Script (.eps)
5) GEM or Ventura (.img)
6) IBM IOCA (.ica)
7) JPEG (.jpg)
8) JIFF (.jif)
9) Kodak Photo-CD (.pcd)
10) Kodak Flashpix (.fpx)
11) LEAD (.cmp)
12) Macintosh PICT (.pct)
13) MacPaint (.mac)
14) Microsoft Paint (.msp)
15) Port Net Graphics (.png)
16) Sun Raster (.ras)
17) Targa (.tga)
18) TIFF (.tif)
19) Windows Metafile (.wmf, .emf)
20) Windows Bitmap (.bmp, .dib)
21) WordPerfect Raster (.wpg)
22) Zsoft PCS or DCX (.pcx, .dcx)

c. Support user-defined icons for field hardware devices. The SMS shall also give System Operators the ability to affect the mode of card readers, open doors, start a trace on a device, mask or unmask alarm inputs, and activate or deactivate or pulse an output from the map icons.
d. The graphical maps shall have the ability to be printed to a local printer.

88. Real-Time Graphical System Status Tree and List Window: The SMS shall support a real-time graphical system status tree or list window that graphically depicts all field hardware devices that are configured in the SMS. The real-time graphical system status tree or list window shall list all ISCs, ICMs, alarm inputs, relay outputs, and card readers. The SMS shall display if the ISCs, alarm input panels, alarm output panels, or RIMs are not currently operating with the most current version of firmware. If applicable, the graphical system status tree or list window shall also list all digital video recorders, video cameras, and intrusion detection devices, zones, and areas. The tree or list window shall show the real time status of all these devices (online vs. offline, alarms activated, masking status, etc.).
89. The graphical system status tree or list window shall include three counters:
    a. Active Counter- a counter of the number of active points in the Monitoring Zone.
    b. Offline Counter - a counter of the number of offline devices in the Monitoring Zone.
    c. Masked Counter - a counter of the number of masked points in the Monitoring Zone.
90. System Operators shall be able to display both list window(s) and graphical system status tree(s). The List Window shall display all hardware devices separately in their own row in the window. The following columns shall exist in the list window: a. Device Name
    b. ISC or ICM or OCM Name c. Current Device Status
91. System Operators shall be able to sort any column in ascending or descending order. System Operators shall also have the ability to choose what types of devices to display in the graphical system status tree or list window. The following choices shall be available: a. Include All Devices

b. Include Specified Devices
   1) Active devices
   2) Offline devices
   3) Masked devices

92. A status bar indicator shall identify the current selections for the list window or graphical system status tree. System Operators shall be able to display multiple graphical system status trees and/or list windows on a single Alarm Monitoring Workstation.
93. The SMS shall give System Operators the ability to acknowledge alarms from the real-time graphical system status tree or list window without going back into the Main Alarm Monitoring Window. The SMS shall also allow System Operators to affect the access mode of card readers, open doors, start a trace on a device, mask or unmask alarm inputs, and activate or deactivate or pulse an output from the tree icons. The system hardware status tree or list window shall have the ability to be printed to a local printer. The SMS shall also allow System Operators to launch a video player to view live video at the video camera selected.
94. Function List icons shall be able to be placed onto the System Status Tree and thus, System Operators shall have the ability to control and activate function lists from the tree.
95. Alarm Masking Group icons shall be able to be placed onto the System Status Tree and thus, System Operators shall have the ability to view the status of the alarm masking groups and control the groups from the System Status Tree.
96. Anti-passback area icons shall be able to be placed onto the System Status Tree and thus, System Operators shall have the ability to control area status (open or closed) from the tree.
97. Automatic Credential Deactivation by Lack of Use: Have an automatic credential deactivation function where a cardholder's credential will automatically deactivate after an extended period of inactivity based upon a predetermined time period. The credential status may be reset by authorized System Operators.
98. Alarm Filtering: Have the capability for filtering out alarm types from the alarm monitoring window. Alarms that may be filtered are access granted alarms, access denied alarms, system alarms, duress alarms, and area control alarms. If applicable, fire alarms, asset alarms, intercom alarms, central station receiver alarms, intrusion detection alarms, video event alarms, and transmitter alarms may also be filtered.
99. Manual Override of Card Readers: Support System Operator overrides of card readers from the alarm monitoring window, graphical maps or the real-time system status tree. Also support the ability to manually set a reader back to default mode.
100. Alarm Masking:
   a. Support the masking of alarms to be controlled on a timezone basis or by manual control.
   b. Support the ability to configure inputs to be "Unable to Mask".
101. Manual Overrides of Alarm Points and Relay Outputs: The SMS shall support System Operator overrides of alarm points and relay outputs configured in the SMS. System Operators shall have the ability to manually mask or unmask an alarm point and/or activate, deactivate, or pulse a relay output from the alarm monitoring window, the graphical maps, or the real-time graphical system status tree.
102. Online Context-Sensitive Help: Provide online context-sensitive help. The help menus shall be available from any window in the SMS by pressing the F1 function key or clicking on the help icon in the toolbar.

103. Sorting Capabilities: Allow System Operators to arrange the way that alarms and/or events in the alarm monitoring window are listed by sorting the alarms and events. Sort criteria shall be based on priority, time or date, ISC, Card Reader, ICM, Input Device, or Cardholder. Additionally alarms and events can be sorted based on asset scan ID, asset name, intercom station, intrusion panel, transmitter, or transmitter input.
104. Alarm aggregation: Alarm aggregation is a mechanism of combining several alarms into a single item (group) based on certain criteria. The SMS's System Administration application shall have an Aggregate option. A user that has permissions to modify alarms shall be able to enable or disable alarms for aggregation. Alarms shall be aggregated in the Main Alarm Monitoring window if the following criteria are met: a. Alarms are of the same type
    b. Alarms are for the same device
    c. The aggregation option is enabled for the alarm type
105. The group of aggregated alarms shall display the number of alarms in the group as a part of the Alarm Description column if the group contains more than one alarm. Additionally, the alarm description shall be displayed using a bold font. All other columns for the group shall display information for the most recent alarm in the group.
106. The SMS's Alarm Monitoring application's operator shall be able to acknowledge or delete a group of aggregated alarms. When acknowledging or deleting a group of aggregated alarms, all alarms in the group shall be acknowledged or deleted. Acknowledge action shall also involve marking in progress. In case of acknowledgment, the progress bar shall be displayed to indicate the progress of the operation.
107. There shall be a Fast or Group Acknowledge command. If the command is applied to one or more groups of aggregated alarms, all alarms from the selected groups shall be acknowledged or marked in progress depending on what option the user selected.
108. Masking of Successful Command Acknowledgements: The SMS shall support the removal of 'success acknowledgements' that are shown in the Main Alarm Monitoring Window after a command has been successfully executed. The SMS shall allow the successful acknowledgements to be removed on a per System Operator basis.
109. Hardware Update Timer: The SMS shall utilize a hardware update timer whereas the System Administrator can set how often system status updates take place. These updates are reflected in the status bar and the real-time graphical system status tree. This frequency shall be defined in one minute increments and shall be changed 'on the fly' by System Operators. Immediate changes in hardware status are reflected immediately in the real-time graphical system status tree.
110. E-mail Interface Option: Support an e-mail interface seamlessly integrated within the SMS Alarm Monitoring application. System Operators shall have the ability to manually or automatically send ASCII text e-mail messages from the Alarm Monitoring application on demand regarding any alarm currently displayed in the Main alarm monitoring window. E-mails shall have to ability to be sent to multiple e-mail accounts if desired. Integrate with Microsoft Exchange Server.
111. Personnel Management and Enrollment:
    a. The SMS shall generate and store personnel records, as well as monitor badge or credential use throughout the facility. These credentials shall be fabricated at any of the SMS enrollment and badging client workstations configured based on data and images that are input and captured at the time of enrollment. Credential images are to be digitized using industry standard JPEG image compression, and printed using a high quality and direct card printing process.

b. Create and Maintain Cardholder Database: A record for each cardholder shall be created in the badging module of the SMS by entering the required data into appropriate data fields. The System Administrator shall be able to define drop-down list box fields for repetitive entered text (for example: Department, Division, Title, Building Number, etc.). Drop-down list boxes shall allow the System Operator a variety of pre-defined choices for data input. The screen design shall be configurable to allow the entry of data in any format desired. The tab order shall be configurable, and the cardholder ID field of up to 18 digits shall be optionally generated by the SMS from either manual System Operator entry, automatic selection of the next available ID, or by use of the cardholder's social security number.
c. Once all fields have been entered, the SMS shall store the applicant's record to the SMS database. These records must be stored in a central database. Updating cardholder data shall be possible at any time by any authorized System Operator. The SMS shall havea field that allows System Administrators to view the last date and time that a cardholder's record has been modified, without running a report. The cardholder form must be user-definable to allow System Administrators to layout the cardholder form.
d. A SMS data import function shall be available to pre-load the SMS with personnel records and industry standard image formats. This import function shall be capable of adding records to the database at any time.
e. The database shall have key fields that are sorted in an index to allow for faster searches. The System Administrator shall be able to designate fields as required and/or unique fields. No record shall be added to the database that does not contain information within the required fields. No record shall be added to the database that contains a duplicate value in a field that was designated as a unique field.
f. Only System Operators with delete privileges (assigned by the System Administrator) shall be able to delete records. Deleting a record shall permanently remove the record from the database (including image files) to free up the disk space for further use.
g. The System Operator shall have the following functions available when enrolling cardholders: choose a badge type, select access levels, enter personal identification numbers (PIN), and/or any other user-defined fields. The SMS shall allow System Administrators the ability to set a default issue code for all first time prints of credentials. The SMS shall also allow System Administrators the ability to auto increment the issue code each time a new Badge is created or to have the System Operator manually enter in a unique issue code each time a new Badge is created. The SMS shall support a minimum of two digits for the cardholder ID issue codes.
h. The SMS shall utilize keyboard or mouse commands that allow System Operators to quickly create a record for any person. The System Administrator shall be able to define drop-down list box fields for the badge type being issued and default values for the other fields based on the badge type.
i. The cardholder form shall also have the option of displaying a cardholder's signature for the record. The cardholder's current Badge information shall also be displayed on the cardholder form complete with Badge ID number, issue code if applicable, activation and deactivation date and time, and the number of times the current badge has been printed.
j. The cardholder form shall also have the ability to display the cardholder's stored images in one of two ways.

1) Photo Display - This option displays the optimum quality photo using the JPEG compressed image stored in the SMS database.
2) No Photo - This option does not show a cardholder photo.

k. The cardholder form shall also display cardholder 'Last Access' information. This field will show the last card reader that the cardholder accessed or attempted to access, complete with a time and date stamp.

112. Modify Existing Field Names of SMS Cardholder Form: The SMS shall provide a method of defining basic user-defined fields. It shall allow System Administrators to rename the standard database fields in the cardholder form of the SMS and move the fields to different locations on the form. Additional functionality shall be available in the advanced Forms Designing and Editing Module.
113. Cardholder Active Badges: A cardholder may possess one or many badges at any one time.
114. If a badge is updated or re-issued, the SMS shall guide the System Operator to first change the existing badge's status to the appropriate classification (de-activate) before a re- issue of the new badge occurs.
115. By utilizing the previously captured image and employee record, the SMS must allow for fast and efficient re-issuance of a badge. As this re-issued badge is printed, the SMS shallupdate its database to remove access rights from the old badge number and activate the new badge number.
116. Each cardholder record shall offer a user-definable activation and expiration date field. The activation date shall be changed by a System Operator to establish a future activation date. A System Operator shall be able to re-activate a card that has been previously de- activated.
117. When issuing a new badge to a cardholder, System Operators shall be able to assign the pre-existing badge deactivation date and time to the badge instead of the default deactivation date and time for new badges. The deactivation date and time may be assigned on a per badge type basis.
118. A badge form will keep a complete history of every badge that was assigned to the cardholder's issue code, badge type, badge status, activation and deactivation dates and times, PIN numbers, embossed numbers, and anti-passback information.
119. Badge status deactivate
120. All active badges can be configured to change to another badge status when the deactivate date has passed. It is possible to configure this system-wide or per badge type. The badge status shall change 24-48 hours after the deactivate date.
121. Multiple Active Badges: The SMS shall support a user configurable Multiple Active Badge feature. This shall allow cardholders in the System to have up to a user-defined pre-determined number of badges active in the SMS at any one time. System Administrators shall have the ability to set the maximum number of active badges allowed in the SMS.
122. Assign Access Levels: At the time a badge is created it shall be possible to have up to 128 access levels assigned to the cardholder's convenience, the System Administrator must be able to define default access levels to be assigned for given badge types. If a System Operator has proper authorization, cardholder access levels shall be modified. When a badge is created with access rights, or modified, that change shall be downloaded to all ISCs immediately upon completion of the change. Record changes for access rights shall affect only the modified record, and shall not require a download of the entire cardholder database.

123. The access changes shall be downloaded to the field hardware as soon as the employee record change is complete. This badge record download shall not effect field hardware operations.
124. When a badge reaches its deactivation date or time the SMS shall automatically deactivate the access rights associated with the badge. All access rights of a badge shall be eliminated after the expiration date. Should the cardholder become authorized for access again, new access rights shall be applicable to the same badge, and re-issue shall not be required. Should an expired cardholder swipe his badge after his card has expired, access shall be denied and an "invalid credential" alarm event shall be generated to the alarm monitoring client workstation.
125. All cardholder information shall be stored for future retrieval or reporting.
126. An access level form shall show System Operators all access levels configured in the SMS and the associated access levels that are assigned to the cardholder's current badge. The SMS shall allow the System Operator to double-click the mouse on any access level to view all of the card reader and timezone combinations that are assigned to that access level.
127. The SMS shall also support access groups, which shall be assigned to cardholders. Access groups will consist of up to thirty two access levels of which shall be viewed by System Operators by clicking on the desired access group.
128. Bulk Assignment or Modification or Deletion of Access Levels: System Administrators or System Operators shall have the option for Bulk Assignment, Modification, and/or Deletion of Access Levels to active badges for a group of cardholders. This feature shall allow System Operators to perform a search of the cardholder database and then apply any additions, modifications, or deletions of access level assignments to all active badges for that group of cardholders.
129. Search Records: The SMS must allow the System Operator to search for records and images using search criteria on any field(s) in the database. The System Operator must be able to enter the search criteria for one or a combination of fields. In addition, partial searches shall be performed. For example, a partial last name search on "Fitz" might return "Fitzpatrick," "Fitzgerald," or "Fitzerbauch." Using a partial name or letter shall return every record in the database that contains that information in its last name field. The SMS shall support basic Boolean logic searches (greater than, greater than or equal to, less than, less than or equal to, equal to). For example, a last name Boolean Search ">B<F" will return to the System Operator all records whose last name begins with the letter C, D, and E. These records shall be viewable sequentially using search keys.
130. The SMS shall allow for the System Administrator the ability to limit the ability of a System Operator to search the database. Thus limiting System Operators, who are using Alarm Monitoring, from searching through records when pulling up the cardholder screen from an event.
131. In a query with no matching records, the SMS must display a message within three (3) seconds indicating that there is no match for the key field information supplied.
132. Bulk Deletion of Cardholder Records: System Administrators shall have the option to perform Bulk Deletion functions for a group of cardholders. This feature shall allow System Administrators to perform a search against the cardholder database and then delete that group of cardholders.
133. Credentials: Support the following credential types and allow for direct Thermal Dye Sublimation printing onto the credential surface.

a. Composite Credentials - 3.375 in. x 2.125 in., UPVC Composite credentials with an ISO standard 30 mil thickness.
b. Proximity credentials: Proximity shall be an access control or identification technology that utilizes radio frequency (RF) circuits in microchip form. The microchips are encoded and transmit the encoded information when activated. The proximity card shall be used with its associated proximity card readers. The SMS shall be provided with the following proximity card design options:
    1) The proximity card shall be a polycarbonate-based card that cannot be run through direct card printers. This card shall offer a clip slot pre-punched.
    2) The proximity card shall be a PVC dual technology card that employs both proximity and magnetic stripe technology. It shall comply with ISO standard for thickness (30 mil). This card shall allow the printing of cardholder record fields including photo directly on the card.
c. Smart Cards P Contact and Contactless:
    1) Contact smart cards shall be utilized for access control or identity verification technology. Through use of an embedded memory chip, protected electronic data shall be stored on the smart card. Standard card configuration shall include cardholder, biometric, and access information. Contact cards shall require insertion into a card reader which interrogates the card via physical contacts. When coupled with a smart card reader, the smart card shall have the processing power to serve as an access control device, for use in network security and physical access control. The SMS must posses the ability to integrate with the ActivIdentity Card Management System. This integration must allow the System Operator the ability to personalize contact smart cards during the badge issuance process. The integration also must allow for communication during such events as badge encoding, activation, deactivation, and deletion.
    2) Support MIFARE® contactless smart card technology. Contactless smart cards shall be utilized for access control and/or identity verification. MIFARE cards, developed by Philips Semiconductors, shall be presented to a card reader for a transaction to take place using wireless transmissions. They shall be passive devices, requiring no built-in power source. Power shall be supplied from energy generated in the coil of the card being places within the radio-wave field of the card reader.
    3) With MIFARE cards, security shall be handled with challenge and response authentication techniques, data ciphering, and message authentication checks. Uniqueness of cards shall be guaranteed through serial numbers that cannot be altered.
    4) Support shall be provided for encoding MIFARE badges with a custom encryption key. This capability will operate in conjunction with readers configured with a matching key, such that these customized credentials will not be recognized by standard MIFARE readers, and standard MIFARE credentials will not be recognized by these customized readers.
    5) The SMS shall support GemEasyLink680 and GemEasyAccess332 or GemProx P2 encoders. Using the GemEasyLink680 and GemEasyAccess332 or GemProx P2 encoders the SMS shall be able to support both 1kByte (8kBit) and 4kByte (32kBit) MIFARE smart cards.

6) The SMS shall support the input of a MIFARE serial number during standalone and inline printing. The SMS shall be able to read the serial number of the MIFARE card during the print process and have it automatically populate the badge ID field.
7) The SMS shall support the creation of genuine, licensed HID format MIFARE badges compatible with standard HID MIFARE readers, without the need to order customized readers from HID.
8) Support shall be provided for the encoding of genuine licensed HID Corporate 1000 format, including full HID Corporate 1000 parity structure, to the HID MIFARE formatted credential.
9) The SMS shall support the creation of vendor-independent Open Encoding Standard (OES) MIFARE badges from completely unprogrammed MIFARE cards. The system shall allow OES badges to be secured with a user-defined MIFARE authentication key for reading, and a different user-defined MIFARE authentication key for writing and modification. The encoding shall be compatible with OEScompliant readers from any manufacturer. In addition to the creation of OES badges, the SMS shall be capable of creating OES re-keying cards that will allow the authentication key of OES compliant MIFARE readers to be reprogrammed without vendor assistance.
10) Support DESfire® contact-less smart card technology. Contactless smart cards shall be utilized for access control and/or identity verification. DESFire cards shall be presented to a card reader for a transaction to take place using wireless transmissions. They shall be passive devices, requiring no built-in power source. Power shall be supplied from energy generated in the coil of the card being places within the radio-wave field of the card reader. With DESFire cards, security shall be handled with challenge and response authentication techniques, data ciphering, and message authentication checks. Uniqueness of cards shall be guaranteed through serial numbers that cannot be altered. The SMS shall support Integrated Engineering SmartID Pro and Phillips Pegoda encoders. Using the encoders the SMS shall be able to support 16k DESFire smart cards.
11) Support HID iCLASS® contactless smart card technology. Contactless smart cards shall be utilized for access control and/or identity verification. iCLASS cards, developed by HID, shall be presented to a card reader for a transaction to take place using wireless transmissions. They shall be passive devices, requiring no-in power source. Power shall be supplied from energy generated in the coil of the card being places within the radio-wave field of the card reader.
12) With iCLASS cards, security shall be handled with challenge and response authentication techniques, data ciphering, and message authentication checks. Uniqueness of cards shall be guaranteed through serial numbers that cannot be altered.
13) Support shall be provided for encoding iCLASS badges with a custom encryption key. This capability will operate in conjunction with readers that have been ordered with a matching key, such that these customized credentials will not be recognized by standard iCLASS readers, and standard iCLASS credentials will not be recognized by these customized readers.
14) Support shall be provided for the encoding of genuine licensed HID Corporate 1000 format, including full HID Corporate 1000 parity structure, to the iCLASS credential.

15) The SMS shall support HID OEM-100 and OEM-150 encoders. Using the HID OEM-100 and OEM 150 encoders the SMS shall be able to support 2k and 16k iCLASS smart cards.
16) US Government Smart Cards: The SMS shall support reading the access control data (FASC-N) from US Government issued Contactless smart cards, including PIV end point dual interface cards, as well as compatible cards such as CAC dual interface cards, so long as the cards conform to the requirements outlined in FIPS-201 and HSPD-12.
17) Support shall be provided for reading the 200 bit BCD FASC-N output of FASC-N readers, and concatenating the Agency Code, System Code, and Credential Code into a full, globally unique 14 character credential number. The concatenated credential number must be the human-readable equivalent of the three fields in a string. Alternative representations are not acceptable.
18) Support shall be provided for reading the 75 bit Wiegand Binary output of GSA approved FASC-N readers, and concatenating the Agency Code, System Code, and Credential Code fields into a full, globally unique 14 character credential number. The concatenated credential number must be the human-readable equivalent of the three fields in a string. Alternative representations are not acceptable.
19) The SMS shall support mapping and importing of the full FASC-N data contained on TWIC (Transportation Worker Identification Credential) and PIV cards. The "Full FASC-N (Hexadecimal)" shall be provided as a field in the FASC-N drop-down in the SMS forms designer tool to map to the full FASC-N data contained on TWIC and PIV cards. TWIC card values shall be mapped to the corresponding cardholder user-defined fields in order to make import possible. A TWIC or PIV import source shall be supported to import the data. If using a TWIC import source, the PIV data shall be imported along with the TWIC Privacy Key and the full FASC-N data. However, if using a PIV import source, only the PIV data shall be imported. A PIN shall be required to import the following PIV data fields: Fingerprints, Facial image, and Printed information. Without a PIN, only these PIV data fields shall be imported: FASC-N, GUID, and Card Expiration Date. The TWIC data shall not require a PIN. It shall be imported into the database for hardware integration use and shall be not visible to the user.

134. Enrollment and Credential Creation - Enrollment:
    a. System Operators shall be able to enroll cardholders on a one by one basis. System Operators will fill in all required fields including name and badge type. The SMS shall Determine a number of attributes based on the cardholder's badge type. These attributes shall be:
        1) Default Deactivation Date or Time - The deactivation date or time shall have the ability be set for a pre-determined number of days, months, or years; or for an exact specified date.
        2) Default Access Levels
        3) Badge Design Layout
        4) Which Printer will Produce the Badge
        5) Information and Encoding Format to be Encoded onto the Magnetic Stripe
135. Based on the badge type selected, additional fields shall be required for data entry above and beyond the standard required fields. For example, a Contractor badge may require the field "Company Representing" to be filled in before the badge can be saved and printed.

a. System Operators shall also enter a Badge ID of up to 18 digits for the cardholder. The cardholder Badge ID shall be determined in one of the following manners:
   1) Manually entered by the System Operator
   2) Automatically generated by the SMS
   3) Use of the Social Security Number as the Badge ID number
   4) Use of EMPID as the Badge ID number

136. Badge ID ranges shall be able to be pre-defined, if desired, by the System Administrator based on Badge Type. For example, the Employee Badge Type may allow Badge IDs to range from 1-49,999 while the Visitor Badge Type Badge IDs range from 50,000-50,999. Multiple Badge ID ranges may be configured for each Badge Type. System Administrators shall have the option of determining how Badge IDs are generated for each Badge Type. For example, the Employee Badge Type shall generate Badge IDs automatically while Visitor Badge IDs must be manually entered into the system at the time of enrollment. Badge ID ranges may be system wide. For example, all Badge IDs(regardless of Badge Type) must fall within a specific range.
137. System Operators shall have the option of utilizing PIN Codes of up to nine digits, embossed numbers, and anti-passback exemptions for each cardholder who is enrolled in the SMS. System Operators shall also assign any temporary access levels for each cardholder that is enrolled.
138. The SMS shall allow for fast and efficient re-assignment of Badge IDs for use for Temporary badges through use of Re-Assignment Wizards. Re-assignment shall be such that the Badge ID shall be stored in the Audit Trail and reported with the cardholder that was assigned to that Badge ID for the specified period of time.
139. Cardholder Image Capture:
   a. Compatible with flash lighting, RGB video cameras, composite input cameras, S-Video input sources, USB sources and digital cameras and allow the capturing of the cardholder image at a minimum resolution of 1024 x 968.
   b. SMS image capture, storage, and hardware compression techniques must be in compliance with the ANSI standard or JPEG (Joint Photographic Experts Group). Cardholder images must be stored as Binary Large Objects (BLOB) within the cardholder record.
   c. Provide the ability to capture a cardholder's image through the use of any industry standard scanner or digital camera that utilizes a TWAIN interface. Images shall be able to be scanned in at up to 16.7 million colors for a true color scanned image. When using a digital camera that supports multiple resolutions, the system shall allow the operator to select the desired resolution.
140. Image Import: Allow for System Operators to have the ability to import a cardholder's image at the time of enrollment. The SMS must support the following image formats:
   a. Bitmaps (.bmp, .dib);
   b. JPEG (.jpg);
   c. JFIF (.jif);
   d. Zsoft PCX or DCX (.pcx, .dcx);
   e. Adobe Photoshop (.psd);
   f. CALS Raster (.cal);
   g. GEM or Ventura IMG (.img);
   h. IBM IOCA (.ica);

i. WordPerfect Raster (.wpg);
j. Macintosh PICT (.pct);
k. Portable Network Graphics (.png);
l. TIFF (.tif);
m. Windows Metafile (.wmf, .emf);
n. Targa (.tga);
o. Kodak Photo CD (.pcd);
p. Kodak Flashpix (.fpx);
q. Encapsulated Post Script (.eps).

141. Auto-crop the Enrollment Photograph: The SMS shall allow the image being captured or imported to be automatically cropped based on the location of the eyes in the captured or imported image. The SMS shall also allow the operator to override the auto-crop with a manual crop window.
142. Crop Window Attributes: The SMS shall allow for the image capture crop window to be both movable and sizable. System Administrators shall have the option to give System Operators the ability to size and/or move the crop window. System Administrators shall have the ability to have the SMS maintain the aspect ratio of the image if the captured image is smaller or larger than the pre-defined image object on the badge.
143. Business Card Scanner Enrollment: The SMS shall support an integrated business card scanner for automatic population of specific visitor information fields. The VMS shall support the Corex CardScan business card scanner.
144. Digital Certificate Management: The SMS shall support Digital Certificate Services to enable System Operators to securely obtain digital certificates for smart card cardholders. The SMS shall allow a System Operator to enroll and issue the smart card to each cardholder during enrollment process. This shall allow the issuing of a Smart Card Logon certificate (which provides authentication) or a Smart Card User certificate (which provides authentication plus the capability to secure e-mail) for the purpose of Smart Card Login to PCs. The Digital Certificate shall allow cardholders to log on to a computer with a smart card, instead of needing to type CTRL+ALT+DEL. The SMS shall be able to link a SMS cardholder account to the cardholder's Active Directory network account.
    a. Smart card readers: The SMS shall support any smart card reader(s) that have been tested by the Microsoft Windows Hardware Quality Lab and have obtained the Windows- compatible logo be installed on Windows 2003 or XP computers.
    b. Supported smart cards: The SMS shall support the Gemplus GemSAFE and Schlumberger Cryptoflex smart cards included in the default Windows 2003 installation.
    c. System Configuration or Network Account Allocation: The SMS shall enforce the allowable number of Network accounts per Cardholder
    d. Linking Network Account to Cardholder Accounts: System Administrators shall be able to link an existing Windows Active Directory Account to an SMS cardholder account. Conversely, System Administrators shall be able to unlink an existing Windows Active Directory Account to an SMS cardholder account.
    e. Manage Certificates: Through services such as DataConduIT, IT Administrators shall provide facilities to notify IT of events in the SMS that would potentially lead to certificates being revoked or suspended. Thus, SMS Certificate Services provide facilities to manually perform following actions on issued certificates:

1) View certificates. The System Administrator shall be able to view certificates issued to a particular cardholder by SMS.
2) Revoke Certificates.
3) Renew Certificates.
4) View Certificate Audit Trail. Each Certificate Authority shall maintain an audit trail of certificate requests and the certificates that are issued until they expire. The audit trail shall record all certificate transactions including failed requests and all of the information contained in each issued certificate. It also shall provide the information that is required to revoke a certificate and add it to the revocation list. System Administrators shall query the audit trail to locate and view information about any certificate request or any certificate that has been issued by the SMS.

145. Card Management System Support
    a. The SMS shall support any smart card reader that has been tested by the Microsoft Windows Hardware Quality Lab and has obtained the Windows-compatible logo to be installed on Windows 2003 or XP Computers.
    b. The SMS shall support ActivIdentity Server, and ActivIdentity Client.
    c. The SMS shall support issuing of a credential with the self-issuance and local issuance model. For self-issuance the credential will be issued a temporary pass code that will allow the cardholder to login to the ActivIdentity Self Service Portal to complete the issuance process. For local issuance the credential will be given a permanent pin number to secure the credential. The credential will also be completely personalized with all certificates and applications, based on the configuration of the CMS system.
    d. The SMS shall support verifying the cardholders fingerprint while the card is being issued. This option shall by configurable as a system wide setting.
    e. The SMS shall read the card serial number during issuance, either inline during the printing process or on a stand-alone PCSC compliant reader or encoder that is connected to the workstation
    f. The SMS shall support the issuance of a card that either has a pending request from a third-party IDMS (Identity Management Server) or create a new request. The issuance of a card based on a previous request, shall be configured as a system wide setting.
    g. The SMS shall support the issuance of a new card and a permanent replacement card. During the issuance of a permanent replacement card the certificates will be transferred to the new card, based on the configuration of the CMS system.
146. Badge Design: Support the ability to create and maintain badge designs. Features shall include the ability to support:
    a. Complete Badge design and Layout tools
    b. Chromakey
    c. Image Import
    d. Ghosting
    e. Signature Capture
    f. Bar code
    g. Smart chip support
147. ID Printers: The SMS shall support double-sided full color printing on those printers in which double-sided full color printing is available. The SMS shall also support edge to edge printing on those printers in which edge to edge printing is available. The SMS shall support high-speed printing on those printers in which high speed printing is available. The

SMS shall also support holographic overlays on those printers in which holographic overlay support is available.

148. Print Limits: The SMS shall allow System Administrators to limit the number of times A cardholder's credential can be printed.
149. Batch Printing: The System Operator must be able to print a credential immediately or continue enrolling cardholders with the intention of batch printing at a later time. The SMS Badging client workstation shall have the ability to print a large volume of badges with a single command using a search command. The System Operator must have the option of printing all badges, printing selected badges, or pre-viewing badges without printing.
150. The SMS shall have a 'log errors' feature for batch printing. This means that the SMS shall skip any Badges that cannot print due to missing information. For example, in a 200 card batch print job, there may be three cards that require information that is not available because the System Operator failed to enter the information. When printing, the SMS shall skip those three cards and print the other 197. A report can later be run to determine what information is missing for the remaining 3 cards.
151. In-line Magnetic Stripe Encoding: Utilizing an in-line magnetic stripe encoding device within the printer, the SMS must allow for magnetic stripe encoding of all its permanent credentials. This magnetic stripe shall conform to ABA Track II and ANSI specifications. The SMS shall allow System Administrators to define attributes for card number, facility code and issue code, as well as starting card number.
152. The SMS shall support a multi-track custom encoding feature. System Administrators shall be able to encode user-defined custom expressions on any of the three (3) tracks of the magnetic stripe of a credential.
153. The following information shall be able to be encoded on any of the three tracks of the magnetic stripe:
    a. Access Control Information
        1) Facility Code
        2) Card Number
        3) Issue Code
    b. ASCII Text
    c. Database Fields
    d. ISO or IEC 7812-1 Check Digit
154. The SMS shall support encoding data onto a JIS II magnetic stripe using JIS II-capable Fargo printers, including the Persona C30, Persona M30, DTC400, DTC550, HDP600, and HDP5000.
155. Image Export: Have the ability to export a captured and cropped cardholder image to an industry standard JPEG (.jpg) file format.
156. Real Time User-definable Image Compression: The SMS must support a real time user-definable image compression utility. The image compression utility shall give System Operators the ability to compare image quality versus compressed image size ratios. This process shall be done in real time and must not require System Operators or System Administrators to go to a program or .ini file outside the program to adjust the ratio. The SMS shall give System Administrators the ability to set SMS default compression settings and give System Operators, with proper permissions, the ability to override those settings. The better the image quality, the larger the image size (affecting hard drive space and speed

of records traveling across the network). 157. Bar code Support: Support the following bar codes: a. Code 3 of 9 (3:1)

b. Code 93
c. UPCA
d. EAN 13
e. EAN 8
f. Code 128 A
g. Code 128 B
h. Code 128 C
i. Codabar
j. PostNet (Zip +4 Postal)
k. Code 3 of 9 (2:1)
l. Interleaved 2 of 5 (2:1)
m. PDF-417 (2D)
n. Code 128 Auto
o. UCC-128
p. MSI Plessey
q. Extended Code 3 of 9
r. Extended Code 93

158. System Management Console: The SMS shall provide a utility that provides system information and access to log files that can be used to aid in troubleshooting SMS issues.
159. System User Feedback Tool: The SMS shall provide a tool to allow the SMS USER the ability to provide feedback from a menu item available in multiple SMS applications. The tool shall launch a Web feedback form that allows the SMS USER to send feedback about the SMS to the MANUFACTURER.
160. Device Discovery Utility
161. The SMS shall provide a Device Discovery Utility (UTILITY). The UTILITY shall allow the ability to discover IP cameras, device servers, access controllers, and wireless access points. The UTILITY shall discover devices in the local subnet as well as across the multiple subnets configured on the network.
162. The UTILITY shall allow searching and discovering IP cameras on a network, specifically for the purpose of identifying the IP cameras' IP addresses. The UTILITY shall be able to search and discover cameras produced by at least six (6) different camera manufacturers.
163. The UTILITY shall allow the ability to discover Lantronix® device servers, LNL-2210, LNL-2220, and LNL-3300 access controllers, and Lenel ILS wireless access points.
164. The UTILITY shall support the ability to turn on or off discovery based on device types and manufacturer. The UTILITY shall support displaying the devices grouped by Brand, Discovery Service, Device Status, and Device Type. The UTILITY shall support displaying the devices sorted by Brand, Model, Version, Command Status, IP Address and Port, Hardware Address, Discovery Service, and Device Type.
165. The UTILITY shall support performing functions (depending on the type of device selected) such as Ping Device, Reboot Device, Check for Default Password, Get Version, Launch Device Web Site, Save Credentials, and Change IP Address.
166. Hardware Devices Notes Field
167. The SMS shall allow users to enter text as notes for the following types of devices:

access panels, readers, video recorders, cameras, fire, intercom, personal safety, receivers, intrusion detection, PLC, POS, and SNMP. These notes shall be available from the SMS's Alarm Monitoring application. The Notes field shall be able to hold a maximum of 1999 characters. The Notes field shall not allow more text to be entered than can be saved. The Notes field shall support Unicode characters for SMS Language Packs.

168. System Administration
    a. System Configuration
169. The SMS shall provide system icons and/or menu selections for each function requiring configuration of SMS options or peripherals (client workstations, field hardware, network functions, communications, reports, etc.). Icon tools bars shall be sizable, movable, and removable. Each form must be in a tab format and shall provide point and click mouse functionality HF<A: R<6BAFS BE 7EBC-down menus to insure configuration is simple. As soon as a function is defined, it shall appear in any other configuration form list that requires that function. The SMS shall support sorting capabilities for multi-column lists. To sort on a multi-column list, the System Operator shall only have to click on the column that is to be sorted.
170. These forms shall be available only to the System Administrator to make system additions or changes to existing configurations. All SMS configuration options and forms shall be documented in the System Administrator's Manual to assist in the selection of options. a. Pre-defined Database
171. System Administrators shall have the option to install a pre-defined database onto their system complete with sample records and configurations. This sample database shall have a configuration that matches that of the VAR demo cases so that VARs can test and troubleshoot the SMS if necessary.
    a. System Configuration Setup Wizards
172. The SMS shall support SMS configuration setup wizards to guide System Administrators through the configuration of the access control module of the system. The setup wizards shall guide System Administrators step by step by asking a series of questions that, when answered, will allow the SMS to automatically configure itself. The setup wizards shall allow for multiple devices to be added in a single command to allow for easy and efficient SMS software setup. There shall be at minimum, setup wizards for Intelligent System Controllers and Card Readers. a. Single Sign-on Support
173. The SMS shall provide support for single sign on capability. Single sign-on shall allow System Administrators or System Operators to authenticate into SMS applications using their Windows domain account.
174. Sign sign-on shall support the following scenarios:
    a. Allow System Administrators or System Operators to interactively run SMS applications without having to enter a username or password. This shall make administration of the SMS easier since maintenance of separate SMS usernames and passwords is not required.
    b. Allow SMS API scripts to authenticate. These scripts shall be run using a Windows account allowing a seamless and secure way to authenticate the account and restricting the script to those actions that the user is permitted to perform.
    c. Password Privileges
        1) The SMS shall allow the System Administrator to configure each client workstation with those applications that may be run on that client workstation. Individual System Operator passwords will further restrict System Operator functions and shall

be specific to each System Operator. Specific System Operator restrictions shall include:

a) Access to screens or functions (for example: alarm monitoring, badge issue)

2) Specific tasks allowed (for example: modify data, view only)
3) Alarm Monitoring functions (for example: clear alarms, output control, traces, reports)

175. If a System Operator is denied access to specific functions, those functions shall not appear (or shall be ghosted) on the System Operator's client workstation or menu bar while that password is logged in. Passwords shall not print in any report.
176. System Administrators and Operators shall have the ability to change their password at any time in the SMS by logging into the SMS with their current password and then changing it through menu options. a. Strong Passwords
177. The SMS shall support the use of strong passwords. a. System Operators
178. The SMS shall support an unlimited number of System Operators at any time. Each System Operator shall be assigned a logon ID and password. Each System Operator shall be assigned permission levels for system administration and configuration functions, Credential Management functions, alarm monitoring functions, digital video management functions, asset management functions, visitor management functions, remote access level management functions, and database field viewing options.
179. The SMS shall be able to provide information on the date and time a new System Operator was created. The SMS shall also be able to provide information on the date and time the System Operator information was last modified. There shall also be a notes field when entering a new System Operator where information in regards to the System Operator can be stored.
    a. System Permissions
180. Every major feature, function, and cardholder page in the SMS shall be permission protected. Each System Operator shall be assigned permission or no permission to use or view or access each feature and function in the SMS. Permission groups shall be broken into three categories: System Administration, Credential Management, and Alarm Monitoring.
181. Every page in the Cardholder Form shall be permission protected. Each System Operator shall be assigned view permissions for each page of information in the Cardholder Form. 182. Every database field in the SMS shall be permission protected. Each System Operator shall be assigned view or edit permissions for each personnel database field in the SMS. 183. Ad-hoc Database Report Generator

184. The SMS must provide an ad-hoc customized report generator package integrated with the SMS's database. This program shall allow the System Administrator to create reports using the relational database structure. Among other reports, a tabular type report shall be configurable which will detail any information from the database in a columnar format with headings, breaks, sub-totals and totals. The report must also be able to be created to produce a flat ASCII export file. Access rights shall be provided to allow the System Administrator the privilege of creating, deleting, updating, saving, processing, viewing and printing reports. The reports are to be printed on a dot matrix printer or on a laser printer. Report configuration shall use menu options and drop-down list boxes to define that database fields are to be used, linked, or joined. They

shall also be used to specify conditions and column order, as well as describe the layout and headings. 185. Custom Report Writer

186. The SMS shall support an industry standard, off the shelf, custom report writer, such as Crystal Reports 11, or 11.5. The custom report writer shall support multiple report types including, but not limited to, multiple section reports, form style reports, conditional reports, query reports, and columnar reports. The custom report writer shall have BLOB Bitmap support and shall come standard with a formula editor with more than 160 built in functions for System Operators to manipulate data. It shall have export capabilities to ASCII files, Microsoft Mail, or ODBC file formats. The custom report writer shall be compatible with industry standard SQL databases, such as Microsoft SQL Server 2005 or Microsoft SQL Server 2008.
187. System Tape Backup
188. A mandatory requirement, the SMS shall provide tape backup and restore programs utilizing the multi-tasking capabilities of the SMS and operating system. These programs shall run concurrently with any other application. Database backup must occur dynamically while other alarm monitoring, badging, access control applications remain active.
189. The tape backup feature shall allow for three levels of tape backup; 1) Incremental, which will back up to tape all changes to data and images that have changed since the last incremental tape backup, 2) System, which will back up the operating system and application files only, and 3) Full, which back ups all files.
190. A database snapshot shall occur prior to a tape backup and the actual backup shall be performed in the background, utilizing the benefits of the multi-tasking operating system, without interfering with the ability of System Operators to exercise other functions.
191. Client workstations
192. System Administrators shall have the ability to configure each client workstation on the SMS to utilize any combination of event printers, CCTV controllers, and video capture boards. For each printer or CCTV controller, System Administrators shall be able to select the port that the device is connected to on the client workstation and the communications speed.
193. PIN Numbers
194. The SMS shall have the ability to support up to nine (9) digit PIN Numbers for each cardholder in the SMS. PIN Numbers shall be created either manually through System Operator entry or generated randomly by the SMS. The SMS shall have the ability to be configured to allow for unique PINs for each cardholder and the ability to modify cardholder's PIN numbers at a later date.
195. List Builder
196. System Administrators shall have the ability to pre-define information that will appear in each of the pre-defined drop-down lists. There shall be no limit to the number of items that shall be a part of a list. Lists can have items added to them or deleted from them at any time.
197. Archiving
198. The SMS shall allow System Administrators to archive offline history files to magnetic media. Offline files shall include access events and System Operator transactions that have been purged from the reportable database. The offline files MUST be in a "ready to import" format for easy insertion of information back into the online database. Different event types may remain in the database for different time periods according to the System Operator's specification.

199. Any record older than the specified dates shall be purged to the offline history file for archiving. Reports shall be generated from the archived files if necessary. Archiving shall be a scheduled, automatic function.
200. Remote Dial-In Capabilities
201. The SMS shall support remote dial-in capabilities for SMS troubleshooting, SMS configuration, and alarm monitoring capabilities.
202. VAR and/or System Administrators shall be able to dial in to the CUSTOMER Database server to troubleshoot the CUSTOMER's system. This will allow System Administrators to locate any problem areas and, many times, fix the error over the telephone from a remote location.
203. Remote dial-in shall also be used for SMS configuration and/or alarm monitoring from remote locations using a client workstation. The client workstation shall have the ability to operate on a Laptop PC that meets the client workstation minimum specifications.
204. Reader Groups

a. The SMS shall support reader groups. The SMS's Grouping form shall be used to: 1) Specify the group or groups to which the reader belongs.
    2) Search for readers by group (The search for readers button is available from all of the forms in the Readers folder.)
    3) Name and save lock group search criteria for future use.
b. Six (6) default reader group drop-downs are provided on the SMS's Grouping form.

205. The SMS shall support a multi-PC, multiple database synchronization architecture (herein after Mobile Enterprise Architecture) using a database server. The database server shall allow multiple wearable or mobile computers to be connected to it (via wired or wireless LAN or WAN architecture). In a stand-alone environment, connections shall occur only during synchronization.
206. The database server shall contain a master copy of all relevant system data. An unlimited number of mobile enterprise client workstations may be connected to the database server.
207. In a stand-alone environment the mobile enterprise computing PC shall contain a copy of all required core information obtained from the database server. This shall include, but not be limited to, cardholders, badges, badge types, and access permissions.
208. Screen Designer Tool

a. SMS Cardholder Standard Fields and Objects

209. The SMS shall support at a minimum the following standard fields for personnel information: 1) Last Name
2) First Name
3) Middle Initial
4) Social Security Number
5) Badge Type
6) Address 1
7) Address 2
8) City
9) State
10) Zip Code
11) Phone Number
12) Birth Date

13) Title
14) Department
15) Division
16) Location
17) Building
18) Floor
19) Office Phone Number
20) Extension
21) Signature
22) Last Reader Accessed
23) Record Last Changed
24) Badge ID
25) Issue Code
26) Number of Prints
27) Activation Date
28) Deactivation Date or Time
29) Badge Status
30) PIN Number
31) Embossed Number
32) Date of Last Badge Print
33) Photo

34) Photo Display

b. SMS Asset Standard Fields and Objects

210. SMS shall support at a minimum the following standard fields for asset information:

1) Scan ID
2) Asset Name
3) Acquired
4) Replace
5) Type
6) Subtype
7) Serial Number
8) Department
9) Assessed Value
10) Replacement Value
11) Last Inspection
12) Next Inspection
13) Record Last Changed
14) Photo
15) Photo Display
16) Last Reader Accessed
17) Assignment Button

b. User-definable Fields

211. Should the SMS standard fields not be suitable, System Administrators shall have the ability to modify any standard field to customize the cardholder, asset, and visitor forms as desired. The SMS shall also allow System Administrators to add custom fields in addition

to or replacement of any standard fields on a minimum of thirty two (32) pages each of information for the cardholder, visitor, and visit forms and one page of information for asset. User-defined fields absolutely shall not be pre-defined, meaning only the labels can change while the properties cannot. System Administrators shall have a minimum of sixteen pages of which to design their screens with standard and custom fields.

a. System Administrators shall have the ability to modify the pages of information in any combination as follows:
   1) Move standard database fields to different locations on the cardholder forms
   2) Delete standard database fields that are not desired
   3) Keep standard database fields in the same location as the factory ships them, but changing the label and/or any field attributes. For example, Zip Code may be changed to Postal Code and the attributes changed from a number field to text field for Canadian Installations
   4) Add new fields to the cardholder forms each with their own unique set of attributes
   b. Field Types

212. The SMS shall support, at a minimum, the following field types:
1) Text Fields
2) Date Fields
3) Numeric Fields 4) Drop-down Lists a. Field Attributes

213. System Administrators shall be able to assign any combination of the following attributes to each field defined:
1) Positioning of the field on the form
2) From which page the field can be viewed
3) From which page the field can be edited
4) The font to be used for the information that will appear in the field. The SMS shall support all standard Windows fonts
5) The style to be used for information that will appear in the field. The SMS shall support bold, italic, both, and regular typeface styles
6) Any effects to be used for the information that will appear in the field. The SMS shall support strikeout and underline
7) Whether the field is required
8) Whether the field is to be indexed
9) Whether the field is unique
10) If a template is to appear in the field
11) If a default value will appear in the field b. Field Styles

214. System Administrators shall be able to assign any combination of the following styles to each field defined: 1) Multi-line field
2) Horizontal Scroll
3) Vertical Scroll
4) Auto Horizontal Scroll
5) Auto Vertical Scroll
6) Enter means next line of text
7) Number
8) Uppercase
9) Lowercase

10) Read Only
11) Align Right
12) Password
13) Sunken
14) Border
15) Inside Edge
16) Raised 17) OEM Covert

b. Field Alignment and Width Tools

215. The SMS shall support the following field alignment tools to allow System Administrators to align fields and set uniform widths to fine tune the look and feel of the screens. The SMS shall allow System Administrators to select multiple objects simultaneously and align them to their desired position and/or set a uniform width. The following field alignment tools shall be able to be used in any combination:

1) Align all objects selected to the far left edge of the farthest left selected object
2) Align all right edges of selected objects to the right edge of the farthest right selected object
3) Align the tops of all selected objects to the top edge of the highest selected object
4) Align the bottom edges of all selected objects to the bottom edge of the lowest selected object
5) Align all selected objects to be vertically centered with respect to each other 6) Center all selected objects
7) Make all selected objects the same width as the smallest object selected
8) Make all selected objects the same width as the widest object selected
9) Make all selected objects the same height as the shortest object selected
10) Make all selected objects the same height as the tallest object selected
11) Evenly space all objects vertically between the two most outer objects
12) Evenly space all objects horizontally between the two most outer objects
13) Bring object to the front of the page 14) Send object to the back of the page a. Tab Ordering

216. The SMS shall allow System Administrators to set the TAB order (the order in which the cursor moves throughout the fields) of the SMS when System Operators utilize the TAB key to move throughout the cardholder form.

217. Map Editor Module

218. The SMS shall support graphical map creation software that shall allow the import of map backgrounds from any standard 'off the shelf' drawing package in the formats listed below:

a. AutoCAD DXF (.dxf)
b. Bitmaps (.bmp, .dib)
c. JPEG (.jpg)
d. JIFF (.jif)
e. Zsoft PCX/DCX (.pcx, .dcx)
f. Adobe Photoshop (.psd)
g. CALS Raster (.cal)
h. GEM/Ventura IMG (.img)
i. IBM IOCA (.ica)
j. WordPerfect Raster (.wpg)

k. Macintosh PICT (.pct)
l. Portable Network Graphics (.png)
m. TIFF (.tif)
n. Windows Metafile (.wmf, .emf)
o. Targa (.tga)
p. Kodak Photo CD (.pcd)
q. Kodak Flashpix (.fpx)
r. Encapsulated Post Script (.eps)

219. These architectural type maps must allow the detailed layout of an entire structure, part of a structure, a floor or department within a building, or layout of the periphery of a facility. Once a map has been drawn, the System Administrator must have the ability to place system level icons of card readers, input and output points, video cameras, and other access control field hardware in the appropriate area to indicate their respective location on the map. This is to be accomplished by simply dragging the icon with the mouse to the appropriate location on the map.
220. The SMS must allow various maps to be associated with each area to provide for the creation of hierarchy of maps. Overview maps of an entire facility shall be able to be viewed as requested and nested maps shall be accessed from the overview map to enlarge a specific area or facility on the screen. Maps shall also support user-defined text that shall be placed onto the map background.
221. The SMS shall allow hardware device icons to be either static or part of a device group. Icons that are part of a device group shall allow the hardware device icon to change shape and/or color based on the current state of the device.
222. Maps shall have the ability to be printed and/or previewed from the Map Editing Module or the Alarm Monitoring application.
223. The SMS shall also support custom device icons to be used with the maps (.ico) files.
224. Import Module: The SMS shall support an import utility, which shall allow the CUSTOMER or VAR to import cardholder information into the SMS database. This shall allow the CUSTOMER or VAR to pre-populate the SMS database with existing cardholder data and/or add NEW records to an existing SMS database. The Import Module only supports SQL Server; it does not support Oracle. For Oracle, DataExchange must be used for data import.
225. The Import Utility shall be a 32-bit Windows application that shall be used to import standard ASCII delimited text files into the SMS. The import utility shall be utilized at the initial SMS setup and anytime a large number of records need to be imported into the SMS after the initial import. For example, a large university may import 10,000 records into the SMS during the initial SMS setup and then import 2,000 additional records each semester thereafter. The SMS shall check for duplicate records during the import, so that multiple copies of the same record are not added into the SMS database.
226. The import utility shall allow System Administrators to choose the delimiter for the ASCII file. This delimiter may be, but is not limited to, a comma, vertical bar, semi-colon, or asterisk. Fields in the SMS database, such as Address 2, that the CUSTOMER does not wish to use, may be left blank in the ASCII file.
227. The import utility shall be able to select the source drive where the ASCII delimited file is located as well as the destination drive where the SMS database is located.

228. The import utility shall also be able to import photos as part of the record into the SMS database. The SMS shall support the following file formats for the import of cardholder photos:

a. Bitmaps (.bmp, .dib)
b. JPEG (.jpg)
c. JIFF (.jif)
d. Zsoft PCX/DCX (.pcx, .dcx)
e. Adobe Photoshop (.psd)
f. CALS Raster (.cal)
g. GEM/Ventura IMG (.img)
h. IBM IOCA (.ica)
i. WordPerfect Raster (.wpg)
j. Macintosh PICT (.pct)
k. Portable Network Graphics (.png)
l. TIFF (.tif)
m. Windows Metafile (.wmf, .emf)
n. Targa (.tga)
o. Kodak Photo CD (.pcd)
p. Kodak Flashpix (.fpx)
q. Encapsulated Post Script (.eps)

229. The SMS shall include a progress meter to show the System Administrator the percentage of the import complete when importing large quantities of records.
230. SMS Server Redundancy

a. The SMS shall support multiple levels of fault tolerance and SMS redundancy listed and described below: 1) Hot Standby Servers
    2) Clustering
    3) Disk Mirroring
    4) RAID Level 10
    5) Distributed Intelligence b. Hot Standby Server Solution

231. The SMS shall support a fault tolerant server and redundant database architecture. It shall allow for normal operations to occur in the event that the Database Server fails. In the event of a server failure, the switch over to a backup server shall be automatic. System Operator intervention for switch over shall not be acceptable.
232. The SMS shall utilize two servers, which shall be configured identically. One server shall be designated as the Primary Server and the other shall be designated as the Backup Server. The Primary Server shall be the main server that is in use when the SMS is operating under normal conditions.
233. The SMS shall mirror the database information from the Primary Server to the Backup Server. This mirroring shall be conducted through standard local area network (LAN) communications. There shall absolutely not be any proprietary communication links between the Primary and Backup Servers.
234. All access control field hardware shall be configured for both the Primary Server and the Backup Server. Both the Primary and Backup Servers shall recognize the same TCP/IP ISC address on the network.
235. If the Backup Server is not running or receiving the mirrored files from the Primary Server, the Primary Server shall save the changes locally. Upon restored communications to the Backup Server, this information shall be automatically sent to the Backup Server.

236. In the event that the Primary Server fails, the Backup Server shall sense that the Primary Server has failed and is no longer on the network. The Backup Server shall check to see if the Primary Server is online every five seconds.
237. Upon sensing Primary Server failure, the Backup Server shall automatically initiate itself as the Primary Server and shall begin communication with the Intelligent Fields Panels. ABSOLUTELY NO SMS OPERATOR INTERVENTION SHALL BE REQUIRED. A message shall be broadcast to all client workstations on the network that the Primary Server has failed and the Backup Server has taken control. This process shall take no longer than two minutes to accomplish.
238. Once the Primary Server comes back online with the SMS, the Primary Server and Backup Server shall be able to be re-synchronized though automatic operation and resume normal operations. The synchronization process shall be fast, efficient, and take no more than five minutes.

a. Clustering

239. The SMS shall support a fault tolerant cluster server architecture. It shall allow for normal operations to occur in the event that the Database Server fails. In the event of a server failure, the switch over to a backup server shall be automatic. System Operator intervention for switch over shall not be acceptable.
240. The SMS shall utilize two servers, which shall be configured identically. One server shall be designated as the Primary Server and the other shall be designated as the Backup Server. The Primary Server shall be the main server that is in use when the SMS is operating under normal conditions.
241. The SMS shall use shared-media technology. This shall incorporate a third piece of hardware (for example: Dell PowerVault), which shall house the hard disk to be referenced by both servers. Since accessible media is dependent upon a third piece of hardware, emphasis shall only be placed upon the health status of the shared-media device. If the status of the shared-media device remains healthy, server up time is of no consequence to data integrity.
242. The shared-media device provides only a single point of failure. If this device fails, then data cannot be accessed. A dual point of failure shall be achieved by incorporating two shared-media devices that are mirrored (for example: two stacked mirrored Dell PowerVaults).
243. All access control field hardware shall be configured for both the Primary Server and the Backup Server. Both the Primary and Backup Servers shall recognize the same TCP/IP ISC address on the network.
244. In the event that the Primary Server fails, the Backup Server shall sense that the Primary Server has failed and is no longer on the network. The Backup Server shall check to see if the Primary Server is online every 5 seconds.
245. Upon sensing Primary Server failure, the Backup Server shall automatically initiate itself as the Primary Server and shall begin communication with the Intelligent Fields Panels. ABSOLUTELY NO SMS OPERATOR INTERVENTION SHALL BE REQUIRED. A message shall be broadcast to all client workstations on the network that the Primary Server has failed and the Backup Server has taken control. This process shall take no longer than 2 minutes to accomplish.
246. Once the Primary Server comes back online with the SMS, the Primary Server shall resume normal operations. a. Disk Mirroring

247. The SMS database server shall protect data against failure of a hard disk or hard disk controller by providing a disk mirroring configuration. The disk mirroring configuration shall allow data to be stored on dual hard disks running simultaneously. When any client workstation or Intelligent System Controller sends data to the database server, it shall be stored to both sets of hard disk drives. In the event any component on one channel fails, the other disk drive continues to operate without data loss or interruption. The SMS shall also send a warning message indicating that one disk drive has failed.

a. RAID Level 10

248. The SMS shall offer a Fault Tolerant Redundant Array of Independent Disks Level 10 (RAID Level 10) with a hot standby disk. RAID Level 10 shall provide redundancy of disk storage, controller channels and power supplies. Each array must contain a disk drive, high efficiency power supply, and cooling fan. This technology shall use multiple drives to store data with distributed parity, thereby ensuring data protection in an environment in which data is safe and easily restorable in the event of a hard disk failure. In the event a single drive within the array fails, a "Hot Standby Hard Disk" shall be available online and automatically switched with the failed unit.
249. The network administrator shall be able to replace the failed drive without taking the database server down, and it shall then become the hot standby. The array software shall rebuild the lost data from parity information stored on the other drives in the array. This entire procedure shall have no effect on the operation of the SMS and shall be automated.
    a. Distributed Intelligence
250. In the event SMS communications is lost or the database server fails, Intelligent System Controllers shall provide complete control, operation and supervision of all monitoring and control points. The ISC shall be configured with a UPS battery, which shall support the ISC for a 24 hour duration. The ISC shall be installed with enough memory to support up to 10,000 cardholders/100,000 events in a minimum configuration and be expandable to up to 250,000 cardholders/1,000,000,000 events.
251. The SMS shall incorporate performance tests and precautions so as to avoid SMS failure. In the event of a failure, transactions are to be stored in an ISC First In First Out (FIFO) buffer until the ISC comes back online, at which time all data is uploaded to the database server. The ISC shall register as online with the database server when communications are re-established. Should the ISC buffer fill and events are overwritten, an event will appear in the Main Alarm Monitoring Window notifying the System Operator that events were overwritten. The ISC shall send a time/date stamp of the last record or table update in its memory and request any new data changes or cardholder records which have changed since that time or date stamp. A complete download of database and access tables shall not be required because of offline operation.
252. Open Protocol Interface
    a. The SMS shall provide a set of standard Application Programming Interfaces (API's) and supporting documentation that allows hardware manufacturers and software application developers to interface their products into the SMS. The Application Programming Interfaces shall allow requests to occur from CUSTOMER to interface a third-party hardware or software solution based on SMS open architecture and SMS device independence.
    b. There shall be two components to the Application Programming Interfaces. There shall be a device interface and an application interface.
    c. The device interface shall allow extensibility to the number and types of hardware devices supported by the SMS. Each individual piece of hardware shall have its own

"driver" that shall understand how to communicate with the SMS hardware. These "drivers" or "device translators" shall translate a set of generic commands into specific device commands.

d. The device translators shall be implemented as COM (Component Object Model) objects so that they shall be loaded and unloaded as needed. Each device translator shall support certain interfaces that support a specific set of commands or methods. Some examples of typical interfaces could include an Access Control Interface for access control hardware, a Video Interface for DVR and NVR hardware, an Intercom Interface for intercom systems, an Intrusion Interface to support alarm inputs, etc. A particular device translator shall support many interfaces.
e. The main application that shall be used to control the various device translators is the SMS Communication Server (SCS). The SCS shall be the application that manages and sends the commands to the device translators. Other modules including Alarm Monitoring or System Administration shall communicate with the hardware devices by sending commands to the SMS Communication Server, which shall then send the commands on to the correct device or devices.
f. The device interface shall allow the software interface of any hardware device to be controlled and monitored via the SMS Alarm Monitoring application. This shall preserve customer investments in existing equipment as well as allow for system expansion to occur through the interface of the latest hardware technologies.
g. The application interface shall allow information to be exchanged between the SMS and other applications. The application interface shall provide the functions for interacting with the SMS. This includes the ability to extract information from the SMS database as well the ability to download, control and monitor information for all field hardware including access control panels, digital video systems, fire panels, alarm panels, intercom system, etc.
h. All functions of the application interface shall be defined in such a way that any Windows application or development environment with the ability to make "C" calls should be capable of making use of the API.

263. Open Supervised Reader Interface

a. The SMS shall provide connectivity to proximity and smartcard readers which provide continuous supervision and monitoring of reader processor and wiring integrity by means of a non-proprietary communications protocol standard. Supervision methods that simply supervise wiring or measure current draw are not acceptable, since they do not insure that the reader's microprocessor is actually operational. Likewise, proprietary protocols which are sole sourced or licensed for a fee are not acceptable, since they limit potential future expansion options for the SMS.

C. The preferred protocol is the Open Supervised Device Protocol (OSDP), since it is non-proprietary and meets the requirements stated above. Alternative supervised reader interface protocols will be considered only if they meet all of the technical requirements of this section AND can be shown to be non-proprietary.

END OF SECURITY MANAGEMENT SYSTEM

This page intentionally left blank

SECTION 28 20 00

CCTV SURVEILLANCE SYSTEM - IP

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK:

A. Extent of work is indicated by the requirements of this section. This specification describes the CCTV Surveillance System to be installed with the requirements and qualifications herein listed.

B. Furnish system complete.

C. Furnish all necessary components and hardware for a complete working system.

D. This specification is intended to provide the CCTV Equipment Contractors with the information and details to be used as the basis for the work described herein.

E. Systems shall be installed under Electrical Section with Electrical Contractor furnishing conduit and requirement power, wiring and pulling wire for CCTV Equipment Contractor, CCTV Equipment Contractor shall make all connections.

F. In many instances only major equipment items are specified and other components and hardware may be required to provide a complete working system.

1.2 SYSTEM DESCRIPTION:

A. This section describes the requirement for electronic surveillance. The system utilizes Closed Circuit Television Camera located as shown on the plans to survey designated areas. Video Signals are processed and displayed on monitors located in the control room and office.

1.3 APPLICABLE CODES AND STANDARDS:

A. U.L. Labels - Provide equipment which has been listed and labeled by Underwriter's Laboratories.

B. FCC Compliance - Comply with Federal Communications Commission Class "B" limits set forth in Subpart "J" of Part 15.

C. NEMA Compliance - Comply with National Electrical Manufacturers Association Standards as applicable.

D. NECA Standard - Comply with applicable portions of the National Electrical Contractors Association's Standard of Installation.

1.4 QUALITY ASSURANCE:

A. Equipment Supplier shall be authorized factory service representative for equipment supplied. Supplier shall maintain an office and service facility with factory trained personnel within fifty (50) miles of the site and provide service within twenty-four hours.

B. The Equipment Supplier's factory trained personnel shall directly supervise the entire installation, connections and tests. Supervision shall include on-the-job instructions for the installation and periodic testing. Final installation and connections for control consoles, equipment cabinets, cameras, etc., shall be made by the Equipment Supplier's trained personnel.

C. Before acceptance, manufacturer's representative will test and certify that the system is installed and functioning properly as intended by drawings and specifications. Test shall include operation of all devised and functions in entire system.

1.5 SHOP DRAWINGS AND CCTV CONTRACTOR WORK:

A. Unless otherwise indicated, provide items required for the complete CCTV Surveillance System as follows:
1. Install and connect all CCTV System equipment as indicated on the drawings.
2. Submit equipment/wiring floor plan layout, detailed terminal wiring diagrams, and equipment manufacturer data sheets prior to any installation of delivery of any equipment to the job site.
3. Provide approved copies of shop drawings which show correct device locations and quantities, correct conduit sizes, and cabling and conductor requirements to the other trades providing related work, supervise and work performed by these trades to assure a workable, completed system.
4. Upon completion of all work, a complete functional test of the entire system shall be performed, and if the system is fully operational, a final acceptance test shall then be scheduled with Owner's designated representative.
5. Provide personnel familiar with the installation and with full access to the system for the final acceptance test.
6. Correct punch list items resulting from the final acceptance test.
7. Provide a one (1) year test and inspection service contract as hereinafter defined.
8. Provide a one (1) year job site guarantee on all material and labor furnished.
9. Provide for any additional conduit of increase in conduit size which are required to make the proposed system functional, but which is not indicated on the design drawings.
10. Furnish all low voltage multi-conductor jacketed cables and low voltage central power conductors as required for a complete and workable system.

1.6 COMMON MANUFACTURER:

1. Equipment furnished in any one category shall be supplied from one manufacturer. For example, all cameras must come from the same manufacturer and all monitors, of the same size, shall be from one manufacturer.
2. Video equipment supplied with same model number shall be of the same series.

PART 2 - PRODUCTS

2.1 APPROVED MANUFACTURERS:

A. All model numbers listed within this proposal are for equipment manufactured by Pelco. Equal products by Bosch will be acceptable.

2.2 IP VIDEO MANAGEMENT SYSTEM

A. The IP video management system shall consist of Digital Sentry® NVs version 7 software operating on an optimized Pelco-supplied hardware platform. The NVs software shall consist of

base software with individual, non-expiring licenses in the required quantity.

B. The IP video management system software updates shall be downloadable from a publicly available website.

C. The IP video management system shall support up to 128 combined IP and analog video streams, with up to 64 direct-attached analog cameras. Analog streams shall be supported using Pelco and/or third-party encoders.

D. The IP video management system shall provide 280 Mbps throughput for recording of analog and IP video streams, playback and export.

E. The IP video management system shall support recording of JPEG, MPEG-4 and H.264 IP streams.

F. The IP video management system shall support Pelco and third-party H.264 Megapixel video streams up to 10 Megapixel resolution with quantities based on a total system of 280 Mbps throughput for recording of analog and IP video streams, playback and export.

G. The IP video management system shall have a fully open architecture with support for both IP-specific camera as well as cameras with ONIVIF compliance.

H. The IP video management system shall support automatic detection of Pelco IP cameras. Third-party IP cameras shall be automatically detected dependent on IP driver versions and manufacturers specifications.

I. The IP video management system shall support up to 64 looping analog camera inputs with direct-attached 16-channel encoders; up to four direct-attached units. The direct-attached 16-channel encoders shall support H.264 compression, CIF, 2CIF, and D1 resolutions at maximum 30ips, 16 audio inputs and RS422/485 PTZ control with Pelco P and D protocols.

J. The IP video management system shall support an unlimited number of systems connected over a network. Each system shall contain two 1GB network ports; one for IP camera/encoder data, and one to connect to a network for client computer access.

K. The IP video management system shall be viewed, managed, and played back through a single user interface simultaneously with other Digital Sentry digital video management systems through supplied DS Admin or DS ControlPoint Client software.

L. The IP video management system shall operate on a 2nd Generation Intel® Core™ i7 processor and 8 GB of RAM.

M. The IP video management system shall utilize a Windows® 7 Ultimate 64-bit operating system.

N. The IP video management system shall support and have an option for an internal DVD+/-RW.

O. The IP video management system shall contain two DVI-D ports.

P. The IP video management system shall allow expansion of IP video channel capacity through a licensing without any hardware modification.

Q. The IP video management system shall support multiple models of IP cameras and encoders including Pelco cameras and encoders with Sarix technology and multiple third-party manufacturers.

R. The IP video management system shall support audio recording from Pelco cameras with Sarix technology in addition to third-party manufacturer's audio recording.

S. The IP video management system shall support recording the internal server with additional storage utilizing SCSI attached Pelco DX8100-HDDI storage.

T. The IP video management system shall be capable of continuous scheduled alarm/event and motion recording. Pre- and post- alarm recording shall also be available and shall be fully programmable on a per channel basis.

U. The IP video management system shall allow archival of video data to computers or SAN storage devices over a network connection with the optional DS Archive Utility. The archival schedule shall be either automatic at user-defined intervals or manual and shall be configurable per connected camera.

V. The IP video management system shall support network health and monitoring utilizing third-party SNMP monitoring tools.

W. The IP video management system shall indicate system performance and operation status utilizing a variety of HTML reports.

X. The IP video management system shall display system health monitoring data utilizing front panel LED displays and display popups.

Y. The IP video management system shall optionally support on-board video analytics in quantities of two or four channels with Active Alert software and the DS DataPoint interface. The DS DataPoint interface shall provide video analytics monitoring including tracking and counting objects and people.

Z. The IP video management system shall support Lightweight Directory Access Protocol (LDAP).

AA. IP Video Management Client Software requirements

1. The IP video management system shall provide the capability of running a client application in additional to the video management system.
2. A client computer with system compatible software shall be the user interface for viewing one or more systems. Live and recorded video and current event video shall be displayed on any client computer using a proper login and password. The client computer shall be able to connect to an unlimited number of recorders simultaneously to display live and recorded video.
3. Client Software shall be unlicensed and available to be installed on as many clients as required by the user.
4. Client Software shall be compatible with multiple DVR and NVR platforms to include all Pelco Digital Sentry®, Pelco DX8000/DX8100, and Pelco DX4100, DX4500/DX4600, DX4700/DX4800.

5. Client Software shall be password controlled such that password functionality set at each connected system will be recognized at the client. Password shall limit the ability to access live or recorded video as well as the ability to export video.
6. Client Software shall allow multiple monitor support for up to four displays per client workstation, providing virtual matrix functionality.
7. Client Software shall allow the connection of Pelco KBD5000 keyboard controllers to the client workstation to control PTZ operations and camera call-up.
8. Client Software shall allow video streams to be selectable from a system tree on an individual camera, individual system, client defined local groups, or from predefined recorder based groups.
9. Client Software shall be a tab based work environment with the ability to undock the tabs creating a virtual workspace on single or multiple monitor clients.
10. Client tabs shall include system management, live, and search options. Tabs can be displayed simultaneously on the client.
11. Systems Tab shall display and sort available systems, connection status, system names, system IP addresses, and custom categories. This tab shall additionally allow:
    a. Manual connect and disconnect of systems to the client
    b. Virtual systems naming
    c. Auto Connecting
    d. Adding, deleting, and editing available systems
    e. Live video tab shall have the ability to be created up to four times on a single client workstation providing for video display combinations and simultaneous video streams from as many different systems with consideration for maximum client bandwidth.
12. Live video tab shall provide the following functionalities:
    a. Quick Review which shall display recorded video from the last 1, 5, 15, 30, 60 or 90 minutes, providing near instantaneous review of recent events
    b. One week graphical display of recorded video
    c. Borderless display option
    d. Screen layout selection
    e. On the fly on-screen display changes including time, date, camera name, frame rate, frame size, alarm display, and border indicators
    f. Digital zoom
    g. User selectable in-video PTZ control or dashboard style control
    h. Drag and drop audio support associating any audio with any video
    i. Search video tab shall allow for the search of one or multiple cameras from one or multiple systems simultaneously. Search tab shall provide the following functionalities:
    j. Time and date search
    k. Advanced data search with DataPoint interfaced software to Active Alert Intelligent Video and POS
    l. Drag and drop audio support to associate audio with any video
13. Video export to any system accessible media including locally to HDD, CD/DVD, Flash USB device or to network storage
14. Video authentication of exported video via check sum verification
15. Alarm video tab shall allow for alarm pop-up and playback of active alarms. Alarms may be based on motion activity, an external software trigger from Active Alert analytics or a preset data alarm from DS DataPoint. An alarm list pane shall be displayed for playback of queued alarms.
16. The Client shall incorporate virtual matrix functionality whereby camera sequences may be created on the monitoring workstation with the following functionalities:

17. Each sequence shall have a maximum of 500 cameras
18. Each camera in the sequence shall have its own individual dwell time, from 1 to 60 seconds
19. Each entry in a sequence shall have the capacity to trigger PTZ camera presets, patterns, or auxiliaries
20. The Client shall have the capability to display recorded video with full VCR controls. This feature shall display video from multiple cameras simultaneously. The user shall be able to play video as fast as possible (all images), in real time, or by skipping a selectable number of seconds
21. The Client shall support simultaneous playback of up to sixteen cameras all synchronized with each other. Non-synchronous playback of multiple cameras shall not be acceptable
22. The Client shall support tours of multi-camera displays
23. Remote Client Minimum PC Requirements
    a. Processor: 2nd Generation Intel® Core i7 processor with integrated graphics
    b. Memory: 4 GB or higher
    c. Graphics Card: Graphics controller card with 512 MB (or greater) dedicated video memory
    d. Optical Drive: DVD
    e. Operating System: Windows 7 (32 or 64 bit)

BB. Network Server Video Recorder/CCTV Workstation
1. Shall be Pelco DSSRV-030-US
2. Supplied Accessories
    a. Power Cord
    b. USB Keyboard and Mouse
    c. Two (2) Bezel keys
    d. Rack Mount Kit (Brackets, rails, and hardware for rack mounting)
    e. DS-SRV-LIT (Documentation, resource and recovery disc)

CC. System Accessories
1. DS-SW-CAM: Includes eight IP licenses for Pelco and third-party IP cameras Additional DS-SW-CAM licenses can be purchased separately
2. ENC5416: Direct-attached analog encoder
3. DS-SRV-RAID: LSI 3Ware 9750-8i RAID controller card
4. DS-SRV-SCSI : Adaptec® SCSI Card 29320LPE
5. ENC5400-2PORT: 2-port host card (analog) connects 2 ENC5416
6. ENC5400-4PORT: 4-port host card (analog) connects 4 ENC5416
7. KBD5000 Keyboard: Desktop keyboard with control pods provides lens, iris and focus control; playback and menu navigation; and monitor control of one DS ControlPoint tear-off tab.

2.3 VIDEO ENCODERS

A. The video encoder shall be standards-compliant and provide a fully supported API that shall integrate with multiple video management systems.

B. The video encoder shall support 1, 2, or 4 camera inputs.

C. The 1- and 2- input video encoders shall support Power over Ethernet (PoE), 802.3af for the 1-input encoder and 802.3at for 2-input encoder. The 4-input encoder shall be powered by a

12VDC source.

D. The video encoder shall generate compressed H.264 video streams in standards-compliant baseline profile, main profile, or high profile. For 4CIF resolution, the encoder shall employ de-interlacing technology to support interlaced cameras while remaining compatible with standards-based decoders at baseline profile.

E. The video encoder shall provide for two independently configurable streams for each camera input. Each stream shall be capable of 4CIF resolution, 30 or 25 images per second (ips), NTSC or PAL. The settings of one stream shall not interfere or limit the settings for the second stream.

F. The video encoder shall be capable of generating 4CIF resolution, real-time video streams while also running intelligent video content analysis algorithms on each camera input. There shall be no need to degrade video resolution or frame rate to execute analytics algorithms.

G. The video encoder shall provide support for running any three Pelco video content analysis algorithms simultaneously on each channel. In addition, the encoder shall also be capable of processing video content analysis algorithms from Object Video.

H. The video encoder shall have provisions for a micro-SD card for each channel input. The video encoder shall be capable of recording JPEGs for alarm conditions on customer-supplied SD cards.

I. The video encoder shall support daisy chaining up to 4 encoders together to minimize the number of network ports utilized on a switch.

J. The video encoder shall provide for 1 line level audio input per video input. The 1- and 2-input encoders shall also provide for a single, line level audio output.

K. The video encoder shall provide for 1 alarm input per camera input. The encoders shall also provide a single relay output per unit.

L. The 1- and 2-input encoders shall support looping video outputs with software-controlled termination.

M. The video encoder shall support PTZ cameras by way of Coaxitron or Pelco D protocol through a serial connection to the RS422 port.

N. When used with Endura, the video encoder shall be capable of digitally signing each frame of video to guarantee the authenticity of digital video all the way back to its source.

O. The video encoder shall support SNMP diagnostic messages and traps and shall be compliant with SNMP versions 1 and 2.

P. The video encoder shall use a standard web browser interface for remote administration and configuration of encoder and camera settings. The browser interface shall support multi-screen remote monitoring for cameras attached to other encoders or Pelco cameras with Sarix technology on the same network subnet.

Q. The network camera shall provide an additional processor for running Pelco Video analytics.
1. Pelco Analytic Suites shall be configured and enabled using a standard Web browser.
2. Pelco Analytic Suites shall allow remote operation and alarm notification when used with an Endura system or a third-party system that supports Pelco's Analytics API.
3. Pelco Analytics for Network Encoders including:
   a. Abandoned Object: Detects objects placed in a defined zone and triggers an alarm if the object remains in the zone longer than the user-defined time allows. An airport terminal is a typical installation for this behavior. This behavior can also detect objects left behind at an ATM, signaling possible card skimming.
   b. Adaptive Motion: Detects and tracks objects that enter a scene and then triggers an alarm when the objects enter a user-defined zone. This behavior is primarily used in outdoor environments with light traffic to reduce the number of false alarms caused by environmental changes.
   c. Camera Sabotage: Detects contrast changes in the field of view. An alarm is triggered if the lens is obstructed with spray paint, a cloth, or a lens cap. Any unauthorized repositioning of the camera also triggers an alarm.
   d. Directional Motion: Generates an alarm in a high traffic area when a person or object moves in a specified direction. Typical installations for this behavior include an airport gate or tunnel where cameras can detect objects moving in the opposite direction of the normal flow of traffic or an individual entering through an exit door.
   e. Loitering Detection: Identifies when people or vehicles remain in a defined zone longer than the user-defined time allows. This behavior is effective in real-time notification of suspicious behavior around ATMs, stairwells, and school grounds.
   f. Object Counting: Counts the number of objects that enter a defined zone or cross a tripwire. This behavior might be used to count the number of people at a store entrance/exit or inside a store where the traffic is light. This behavior is based on tracking and does not count people in a crowded setting.
   g. Object Removal: Triggers an alarm if an object is removed from a defined zone. This behavior is ideal for customers who want to detect the removal of high value objects, such as a painting from a wall or a statue from a pedestal.
   h. Stopped Vehicle: Detects vehicles stopped near a sensitive area longer than the user-defined time allows. This behavior is ideal for airport curbside drop-offs, parking enforcement, suspicious parking, traffic lane breakdowns, and vehicles waiting at gates.
4. Pelco Analytic Suites shall be preloaded or configuration and alarm notification when used with an Endura® system or a third-party system that supports Pelco's Analytics API.
5. Multiple Pelco behaviors can be scheduled to work during a certain time or condition.

R. ObjectVideo® Analytics for EP High Definition Digital Network Cameras

1. ObjectVideo (OV) intelligent video analytics technology shall be embedded in Pelco EP network cameras with Sarix technology, enabling rule configuration and alarm notification when using OV Ready™ systems.
2. OV analytics shall be made available in three suites: OV Security Suite, OV Security Suite Plus and OV Event Counting Suite. These suites shall provide a spectrum of settings to allow use of the behaviors in a variety of applications. The technology shall help users identify situations of interest, such as surveillance and business effectiveness analysis.
3. OV Security Suite shall include Tripwire Detection, Inside Area Detection, and Camera Tamper Detection behaviors: Tripwire Detection shall identify objects that cross a user-defined line drawn within the camera's field of view; Inside Area Detection shall identify

objects entering, appearing, or moving within a user-defined area; and Camera Tamper Detection shall detect changes in the camera field of view, including obstruction of lens (such as by cloth, spray paint, or a lens cap cover) and unauthorized movement of the camera.

4. OV Security Suite Plus shall include (in addition to all behaviors of the Security Suite) Multi-Line Tripwire Detection, Loitering Detection, and Leave Behind Detection behaviors: Multi-Line Tripwire Detection shall track objects that cross two defined lines, which can be defined by parameters such as direction, sequential order, and the time it takes to cross both tripwires; Loitering Detection shall analyze how frequently people remain for a specified period of time within a defined area, allowing for real-time notification of suspicious behavior around ATMs, stairwells, and school grounds; and Leave Behind Detection shall detect objects placed in a defined zone and trigger an alarm if the object remains in the specified zone longer than the user-defined time allows.
5. OV Event Counting Suite shall use advanced object calibration and additional features for schedules, parameters, and multiple rules. The suite shall include behaviors for Tripwire Counting, Enters/Exits Counting, Loiter Counting, Occupancy Sensing, and Dwell-Time Monitoring: Tripwire Counting shall count people or objects that cross a user-defined line; Enters/Exits Counting shall calculate the number of people that enter and exit an area without using a tripwire; Loiter Counting shall calculate people who stop in front of a defined area of interest (such as a display or product); Occupancy Sensing shall count people, generating a new value every time the occupancy level changes and time stamping each occupancy output, allowing the data to be used to determine average occupancy levels or to correlate data to point-of-sale or other business scenarios; and Dwell-Time Monitoring shall determine the time between which an object enters and exits an area, provide queue size information, and allow assessment of wait times.

S. Model Number
   1. Pelco NET5400 series, Video Encoders

2.4 INDOOR DIGITAL (IP) NETWORK MINI DOME CAMERAS

A. Shall be Pelco IMS0LW10-1 Sarix indoor fixed IP mini dome camera with SureVision, 0.5 Mpxl, low-light, WDR, day/night, 2.8~10mm varifocal megapixel lens, clear dome

2.5 EXTERIOR (WEATHERPROOF) DIGITAL (IP) NETWORK MINI DOME CAMERAS

A. Shall be Pelco #IM10DN10-1E Sarix environmental, indoor/outdoor mini fixed dome IP camera 1.3 Mpxl, day/night, 2.8~10mm varifocal megapixel lens, clear dome with #WMVE-WR/IM-VEPM vandal-resistant wall-mount with pendant accessory

2.6 HIGH DEFINITION CCTV MONITOR

A. The CCTV monitor shall offer the following features: VGA, DisplayPort, and digital visual interface (DVI) inputs, looping BNC output, full high definition resolution, and 32” (minimum) LCD display.

B. The LCD monitor shall provide picture-in-picture (PIP) capability.

C. The Narrow Bezel LCD monitor shall be capable of providing a minimum of 1920 x 1080p native resolution.

D. Model Number
1. Pelco PMCL532F with PMCL-WMT tilt/swivel wall mount

2.7 EQUIPMENT RACKS

A. All digital recorders, video encoders, patch panels and other similar equipment shall be mounted in standard data racks at telephone backboards. CCTV system supplier may utilize space within rack furnished by the Structured Cabling Contractor if available, or may furnish a separate wall-mounted, hinged rack meeting the requirements of the Structured Cabling System specifications section.

2.8 CABLING

A. All Ethernet cabling to cameras shall be yellow, Cat6.

B. Refer to plans and the following specifications sections for cabling requirements:
1. Section 27 05 00: Auxiliary System Cables, 0-50V
2. Section 27 10 00: Structured Cabling System

2.9 MISCELLANEOUS AND OTHER EQUIPMENT

A. Furnish all miscellaneous hardware, connectors, wire/cable and components required for complete functioning system.

PART 3 - EXECUTION

3.1 INSTALLATION:

A. Work under this section shall be of professional quality with emphasis on neatness and workmanship.

B. Guarantee workmanship and/or material executed under this division for three (3) years after final acceptance. In the event that project is occupied or systems placed in operation in several phases at Owner's request, guarantee will begin on date each system or time of equipment is accepted by Owner.

C. Focal length of lenses for various cameras shall be determined on site, as well as exact positions of camera. Contractors shall supply portable equipment, camera, monitor, and assorted lenses for field test to make determinations. Test shall be scheduled with, and made in the presence of, the Owner's Representative and the Engineer.

D. All Cat6 cabling shall be installed by the Structured Cabling Contractor per Specification Section 27 10 00. Refer to Specification Sections 27 05 00 and 27 10 00 for additional cable installation requirements.

3.2 OBSERVATIONS OF WORK AND DEMONSTRATION OF OPERATION:

A. Final inspections shall include, but are not limited to, a demonstration to the Engineer and Owner's Representative of all functions and controls of system being tested. Architect's column on test plan will be executed during final. Sufficient Sub-Contractor personnel shall be on site to demonstrate systems. Personnel shall be knowledgeable about all system hardware and software where applicable.

END OF SECTION 28 20 00

SECTION 28 31 00

FIRE ALARM SYSTEM

PART 1 - GENERAL

1.1 SCOPE

A. The Contractor shall furnish and install a complete low voltage, automatic and manual fire alarm system as specified herein and indicated on the drawings.

B. The system shall include a central control panel, power supply, signal initiating devices, audible and visual alarm devices, a conduit and wiring system and all necessary accessories required to provide a complete operating system.

C. The system shall be completely addressable.

D. The system shall comply with the applicable provisions of the National Fire Protection Association Standard Number 72 (National Fire Alarm Code) for fire alarm systems; N.E.C. Article 760; and meet all requirements of the local authorities having jurisdiction.

E. The system shall be provided by a local service organization located within 50 miles of the job site.

1.2 DESCRIPTION OF SYSTEM

A. Conduit, outlet boxes, cabinets, devices and wiring installation for complete fire detection and alarm system.

B. Each and every item of the Fire Alarm System shall be listed as a product of a SINGLE fire alarm system manufacturer under the appropriate category by Underwriter's Laboratories, Inc. (UL), and shall bear the "UL" label. All control equipment shall be listed under UL category UOBZ as a single control unit. Partial listing shall not be acceptable. System controls shall be UL listed for Power Limited Applications per N.E.C. Article 760. All circuits shall be marked in accordance with N.E.C. 760-23.

C. Wiring shown is diagrammatic to define system and is not intended to show every wire. Review drawings prior to bidding and inform Contractor of any additional wiring necessary for installation of systems. Wiring shall comply with pathway survivability requirements defined in NFPA 72. Include cost of all wiring in bid.

D. Submit complete shop drawings of system for review including terminal to terminal connection diagrams for system components and associated equipment interfaces, conduit diagrams, complete descriptive information on each item of equipment including UL listing for all system components, and any other information required by Architect to describe system. Identify color code and terminal numbers on shop drawings.

E. After completion of work, submit one set of record mylar sepias with items for Owner described above. Typical type drawings will not be accepted.

F. Manufacturer's trained technical representative shall supervise installation, connections and tests. The authority having jurisdiction shall be notified prior to installation or alteration of equipment or wiring. Before acceptance, manufacturer's representative will test and certify in writing that system is installed and functioning properly as intended by drawings and specifications. Test includes operation of all devices in entire system.

G. Guarantee entire system in writing for one year from date of acceptance by Owner. Guarantee will cover completely all components, equipment, wiring, etc. Repair any defects found in the system within the guarantee period without cost to owner.

H. Submit with bid a guaranteed price for complete maintenance and service of system for one year beginning at expiration of guarantee period. Price shall be guaranteed for acceptance by Owner until date of substantial completion of system.

1.3 SYSTEM OPERATION

A. Actuation of any alarm initiating device shall cause all audible alarm signals to sound, all visual indicating appliances to flash, activate an alarm LED and local tone-alert at control panel/annunciator, cause an LCD read-out of point in alarm including type of alarm (smoke detector, manual station, etc.), provide a signal to the mechanical controls to shut down or re-route air handling systems according to established plans. This shall include a suitable addressable relay at each air handling unit to shut down all air handlers in a given zone when system goes into alarm.

B. The general alarm devices may be silenced by authorized personnel only, by entering a locked cabinet and operating the proper silencing switch. A subsequent zone alarm shall reactivate the signals. Operation of the silencing switch shall be indicated by a trouble light and audible signal.

C. Operation of any sprinkler monitoring switch, power failure, opens, grounds, or any disarrangement of the system wiring or components shall be indicated by a visual and audible trouble signal. The audible trouble signal may be silenced; however, the trouble LED shall remain lit until the system has been returned to normal operating condition.

D. Analog Smoke Sensor Operation
1. The smoke sensor shall be a smoke density measuring device having no self contained alarm set-point. The alarm decision for each sensor shall be determined by the control panel. The control panel shall determine the condition of each sensor by comparing the sensor value to stored values.
2. The control panel shall maintain a moving average of the sensors smoke chamber value. Systems that do not automatically maintain a constant smoke obscuration sensitivity for each sensor by compensating for environmental factors and are deemed unacceptable.
3. The system shall automatically indicate when an individual sensor needs cleaning. When a sensor’s average value reaches a predetermined value, a “Dirty Sensor” trouble condition shall be audibly and visually indicated at the control panel for the individual sensor. Additionally, the LED on the sensor base shall glow steady giving a visible indication at the sensor location.
4. If a “Dirty Sensor” is left unattended, and its average value increases to a second predetermined value, an “Excessively Dirty Sensor” trouble condition shall be indicated at the control panel for the individual sensor.

5. The control panel shall automatically perform a daily self-test on each sensor. Checking the electronics in the sensor's base ensures the accuracy of the values being transmitted to the control panel. A sensor which fails the self-test will cause a "Self Test Abnormal" trouble condition at the control panel. A sensor self-test which must be manually initiated by the operator shall not be acceptable.

1.4 SYSTEM FEATURES

A. The fire alarm system shall include the following features as a minimum:
1. Supervision of all field wiring.
2. Microprocessor based solid state modular construction.
3. Ground fault detection and ground fault isolating & supervising circuitry.
4. 80 character LCD display to indicate alarms, supervisory service conditions and troubles.
5. Simultaneous test of all LED's and LCD's from a central point.
6. "Dead Front" design control panel/annunciator with field programmable LED alarm, status and trouble indicators, and all control switches located behind a locked tempered glass door.
7. Fully automatic battery charger and lead alkaline batteries. Batteries shall have capacity to maintain system operation for 24 hours in normal supervisory mode and shall have sufficient capacity remaining to operate in alarm mode for 15 minutes at conclusion of supervisory period. Batteries shall be supervised for connection to the system and for low voltage threshold. Ammeter and voltmeter shall be provided to indicate battery voltage and charging current.
8. Two (2) sets of 2 amp form C auxiliary alarm contacts fused with feedback.
9. One (1) set of 2 amp form C auxiliary trouble contacts.
10. Standard with 127 addressable points (expandable to 508 points) and four input/output (I/0) circuits (expandable to 20 circuits).
11. Basic four (4) amp power supply (expandable as required).
12. 600 event historical logging.
13. System shall be field programmable for offsite monitoring by remote station reverse polarity, local energy master box or shunt master box types.
14. System shall be field programmable for signal circuit type of operation; march time code, temporal code, selective code, zone code, general alarm, time limit cutout and alarm silence inhibit.
15. System shall be field programmable for waterflow/sprinkler supervisory operation on distinct zones as required.
16. Transient suppression protection shall be provided on the system power supply and on the municipal protection circuit to comply with UL 864 requirements. Additionally, surge suppression shall be provided within the control panel on all circuits that extend outside the building (including to roof-mounted HVAC units).
17. Supervised remote annunciator connection circuit.
18. System shall incorporate an alarm/trouble walk test.
19. Resident non-volatile programmable operating system memory for all operating requirements.

PART 2 - PRODUCTS

2.1 FIRE ALARM CONTROL PANELS/ANNUNCIATORS

A. Furnish and install Simplex type 4020-9101 fire alarm control panel(s) with options and accessories as required.

2.2 MANUAL ALARM STATIONS

A. Manual alarm stations shall be Simplex addressable type 4099-9002 break glass (double-action). The station body shall be so constructed that chips and scratches will not expose metal. All stations shall be master keyed with the control equipment. When actuated, the "Pull Lever" shall remain at right angle to the station body until reset.

B. Boxes:
1. Recessed, two-gang outlet boxes with Simplex type 2099-9813 red, semi-flush trim plates shall be used where possible.
2. Where surface-mount outlet boxes are required, boxes shall be red, cast aluminum Simplex type 2975-9022.

2.3 PHOTOELECTRIC SMOKE SENSOR

A. The smoke sensors shall be of the photoelectric addressable Simplex type 4098-9714 and shall communicate actual smoke chamber values to the system control panel. The smoke sensors shall operate on the light scatter principle. For maximum maintenance free service and low power requirement, light source for detection chamber and visual alarm indication shall be solid state photodiode.

B. Each sensor base shall be visually and electrically supervised.

C. The sensors shall be listed to UL Standard 268 and shall be documented compatible with the control equipment to which they are connected. The sensors shall be listed for both ceiling and wall mount applications.

D. Each sensor base shall contain integral addressable electronics and an LED that will flash each time it is scanned by the control panel (once every 4 seconds). The control panel shall be responsible for drift compensation. When the control panel determines that a sensor is in an alarm or a trouble condition, the control panel shall command the LED on that sensor's base to turn on steady indicating the abnormal condition. Sensors which do not provide a visible indication of an abnormal condition at the sensor location shall not be acceptable. Sensor bases shall be compatible with detachable photoelectric, ionization and heat sensors so that these various sensor types can be easily interchanged to meet specific location requirements. Sensor base shall be addressable type as required.

E. Where required, sensor bases shall be provided with a relay driver output and supervised relay, which are to be controlled either automatically or manually from the control panel.

F. Each sensor base shall be scanned by the control panel for its type identification to prevent inadvertent substitution of the wrong sensor type. The control panel shall operate with the installed device but shall initiate a "Wrong Device" trouble condition until the proper type is installed or the programmed sensor type is changed.

G. Each sensor shall contain a magnetically actuated test switch to provide for easy alarm testing at the sensor location.

H. The sensor's electronics shall be immune from false alarms caused by EMI and RFI.

I. Cover all smoke detection devices with plastic bags immediately after installation to maintain cleanliness, if field conditions so require.

J. Provide a U.L. listed sensor guard for sensors in areas subject to tampering. The guard shall be suitable for ceiling or sidewall mounting and hinged for easy access. The guard shall be securely mounted with tamper-proof screws.

2.4 PHOTOELECTRIC DUCT DETECTOR

A. The detector shall be an addressable, non-polarized 24VDC, Simplex type 4098-9755, which is compatible with the Fire Alarm Control Panel and obtains its operating power from the supervisory current in the fire alarm detection loop. It shall be of the same analog type as the ceiling smoke detectors. Detectors shall be of the solid state photoelectric type and shall operate on the light scattering, photodiode principle. To minimize nuisance alarms, detectors shall have an insect screen and be designed to ignore invisible airborne particles or smoke densities that are below the factory set alarm point. No radioactive material shall be used.

B. The detector head shall be directly interchangeable with an ionization detector type. The 24VDC detector may be reset by actuating the control panel reset switch.

C. Detector construction shall have a mounting base with a twist-lock detecting head that is lockable. The locking feature must be field removable when not required. Contract between the base and head shall be of the bifurcated type utilizing spring type, self-wiping contacts. Removal of the detector head shall interrupt the supervisory circuit of the fire alarm detection loop and cause a trouble signal at the control panel.

D. Sampling tubes sized to match duct size as recommended by equipment manufacturer shall be provided with duct detectors as required.

E. Detector design shall provide compatibility with other normally open fire alarm detection loop devices (heat detectors, pull stations, etc.). It shall be possible to alarm the duct housing by using a test switch. For maintenance purposes, it shall be possible to clean the duct housing sampling tubes by accessing them through the duct housings front cover.

F. To minimize false alarms, voltage and RF transient suppression techniques shall be employed as-well-as smoke signal verification circuit and an insect screen.

G. Separate auxiliary SPDT relays for fan shutdown shall be provided with each duct detector for fan shutdown, smoke evacuation or other purposes as indicated on plans.

H. Remote key operated test stations with LED alarm indicators shall be installed in an accessible, inconspicuous location for each duct detector.

I. Duct detectors shall be installed for the equipment as indicated on plans as follows (locations shown on plans are diagrammatical only):
   1. A minimum of six duct widths downstream from bends or inlets to avoid air turbulence.
   2. On the downstream side of filters to detect fires in the filters.
   3. In return ducts, ahead of mixing areas.
   4. Upstream of air humidifier and cooling coil.
   5. With accessibility for test and service.

J. The following duct detector locations shall be avoided:
1. Where dampers closed for comfort control would interfere with airflow.
2. Next to outside air inlets (unless the intent is to monitor smoke entry from that area).
3. In return air damper branch ducts and mixing areas where airflow may be restricted.

K. Where duct detectors are installed in exterior or wet locations, weatherproof duct housing enclosures shall be provided to protect the detectors. Enclosures shall be located to be in shaded areas rather than direct sunlight. Entire installation shall be as directed by the equipment manufacturer.

2.5 HEAT SENSORS

A. Heat sensors shall be U.L. listed, addressable Simplex type 4098-9733. They shall provide rate-of-rise temperature sensing, fixed temperature sensing (135 degrees F) and utility temperature sensing (32 degrees F to 155 degrees F range).

B. Each sensor base shall be visually and electrically supervised.

C. The sensors shall be listed to UL Standard 268 and shall be documented compatible with the control equipment to which they are connected. The sensors shall be listed for both ceiling and wall mount applications.

D. Each sensor base shall contain integral addressable electronics and an LED that will flash each time it is scanned by the control panel (once every 4 seconds). The control panel shall be responsible for drift compensation. When the control panel determines that a sensor is in an alarm or a trouble condition, the control panel shall command the LED on that sensor's base to turn on steady indicating the abnormal condition. Sensors which do not provide a visible indication of an abnormal condition at the sensor location shall not be acceptable. Sensor bases shall be compatible with detachable photoelectric, ionization and heat sensors so that these various sensor types can be easily interchanged to meet specific location requirements. Sensor base shall be addressable type as required.

E. Where required, sensor bases shall be provided with a relay driver output and supervised relay, which are to be controlled either automatically or manually from the control panel.

F. Each sensor base shall be scanned by the control panel for its type identification to prevent inadvertent substitution of the wrong sensor type. The control panel shall operate with the installed device but shall initiate a "Wrong Device" trouble condition until the proper type is installed or the programmed sensor type is changed.

G. Each sensor shall contain a magnetically actuated test switch to provide for easy alarm testing at the sensor location.

H. The sensor's electronics shall be immune from false alarms caused by EMI and RFI.

I. Heat sensor shall be automatically restorable.

2.6 MAGNETIC DOOR HOLDERS

A. Provide Simplex type 2088 series magnetic door holders as required where shown on plans.

2.7 ALARM SIGNALS (AUDIBLE)

A. Horns:
1. Alarm horns shall be Simplex type 4901-9820. The horns shall be polarized and shall be operated by 24 VDC. Each horn assembly shall include separate wire leads for in/out wiring for each leg of the associated signal circuit. T-tapping of signal device conductors to signal circuit conductors shall NOT be accepted. Where horns are shown as a combination audio-visual assembly, they shall be mounted as a combination unit in a single back box (4903 series) . Horns shall be capable of producing 95 dB.

B. Electronic Chimes:
1. Electronic chimes shall be Simplex type 2902 series. The chime shall be polarized and shall be operated by 24 VDC with a minimum of 82 dB at 10 ft. Adaptors shall allow surface, semi-flush, weather resistance, or audio/visual mounting as shown on the plans.
2. Chimes shall have field adjustable volume control. They shall be provided with four (4) connections to insure properly supervised in/out system connection. Chime shall be U.L. listed for its intended purpose. Where chimes are shown as a combination audible-visual assembly, they shall be mounted as a combination unit with an adapter in a single back box.

C. Devices required to be surface mounted shall be furnished with Simplex type 2975-9145 surface mounting box and 4905-9903 adaptor plate.

D. Devices installed in areas subject to mechanical damage (ie. gymnasiums) shall be furnished with suitable wire guards as indicated on plans.

2.8 ALARM SIGNALS (VISUALS)

A. Visual Flashing Lamps (Xenon Strobe):
1. Furnish and install per plans and specs Simplex type 4904 series visible appliance for fire alarm system notification. The appliance shall be 1HZ synchronized (15cd, 30cd, 110cd) with polar distribution or 75 cd illumination as required by the Americans with Disabilities Act (ADA). The appliance shall be U.L. listed to Standard 1971 and have a circumpolar light output allowing mounting in either vertical or horizontal positions or on the ceiling.
2. The light unit shall be of ABS polycarbonate and the lens of high grade, optical quality LEXAN. For optimized light distribution, the xenon flash tube shall be installed perpendicular to the appliance's back plane. A special compound reflector shall be utilized to maximize and best distribute the light pattern in key axis directions.
3. The effect of the illuminated visible appliance shall be observable in a circumpolar pattern. The visible appliance shall be labeled with the word "FIRE" in a contrasting color and the height of each character shall be a minimum of 5/8 inches. In its quiescent state, the word "FIRE" shall be visible.
4. Mounting heights of visual appliances shall in all respects comply with the Americans with Disabilities Act.
5. Visual indicating appliances shall be Simplex type 4904 series and comprised of a Xenon flashtube and be entirely solid state. These devices shall be U.L. listed and be capable of either ceiling or wall mounting. The LEXAN lens shall be pyramidal in shape to allow better visibility. Visual units shall be of the stand alone type.

2.9 REMOTE ANNUNCIATOR

A. Where shown on the plans, provide and install an LCD annunciator. The annunciator(s) shall have a stainless steel finish and shall provide the same functionality as the main control panel front panel display. The annunciator shall communicate to the control panel over one twisted shielded pair of wire and operating power shall be 24VDC and be fused at the control panel. Point-wired annunciators will not be considered as equal.

B. The serial annunciator shall provide a common alarm and trouble circuit consisting of:
1. Control push-button switches – for alarm silence, trouble silence, system reset and manual evacuation duplicating the control panel switches. A key "enable" switch shall be provided to activate or deactivate the control switches.
2. Tone Alert – Duplicates the control panel tone alert during alarm and trouble conditions.
3. System trouble LED.
4. Power on LED.

C. To accommodate and facilitate job site changes the control switches shall have the capability to be programmed on site to provide for manual switch input operation other than their standard purpose.

2.10 SPRINKLER FLOW SWITCHES

A. Sprinkler flow switches and supervisory switches are provided under another section of these specifications. This contractor shall be responsible for electrical connection of these devices to the fire alarm system.

2.11 SMOKE DAMPERS

A. Smoke dampers are provided under another section. This contractor shall be responsible for supplying a source of power and connecting them to the fire alarm system to close on alarm.

2.12 SYSTEM RECORD DOCUMENT CABINET

A. Furnish and install a documentation cabinet at the system control unit or other approved location. All final record documentation shall be stored in the cabinet. Cabinet shall be labeled as "SYSTEM RECORD DOCUMENTS". Cabinet shall include a 4 gigabyte digital flash drive interface with USB connector loaded with a digital copy of all system documentation including shop drawings and product data.

2.13 OFF SITE MONITORING

A. Furnish all material and labor to accomplish and coordinate with local company or fire department as necessary for off site monitoring of the Fire Alarm System. Transmission method(s) shall be as required by applicable codes and Authority Having Jurisdiction (AHJ). Off site monitoring shall be in operation prior to final acceptance. Exact type of off site monitoring (basic reporting or advanced reporting as described below) shall be provided by the contractor per the owner's direction.

B. Furnish and install serial digital alarm communicating transmitter (DACT), capable of reporting specific alarm points to the central station. DACT shall be universal in that it can be utilized to either provide basic reporting (alarm, trouble, supervisory conditions) or more advanced reporting (point-to-point reporting of specific alarm conditions) DACT shall be mounted integral to or beside fire alarm control panel.

2.14 FIRE ALARM CABLING

1. All fire alarm cabling shall:
   a. Have red outer insulation/jacket with ripcord.
   b. Be listed and labeled for the intended use in Fire Alarm systems.
   c. Where Level 2 or Level 3 pathway survivability is required by NFPA 72, cabling shall be 2-hour fire rated circuit integrity (CI) type.
   d. Be manufactured by West Penn, Allied, Belden or Superior Essex.

2.15 FIRE ALARM SYSTEM MANUFACTURER

A. All equipment shall be listed by UL. All panels and peripheral devices shall be the standard equipment of a single manufacturer and shall display the manufacturer's name on each component. Manufacturer's numbers specified in this section are those of Simplex Time Recorder Company to denote type, quality, material and desired operating features to be furnished.

B. Equipment shall be as manufactured by Simplex, Notifier or EST.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Provide and install the system in accordance with the plans and specifications, all applicable codes and the manufacturer's recommendations.

B. The contractor shall provide 120VAC power to all remote booster power supplies, control panels, transponder cabinets or other similar items as required. Where the project is provided with emergency power from an emergency generator, all power supplies shall be connected to an emergency source. Dedicated branch circuit(s) shall be provided to supply primary power to the fire alarm system. The associated branch circuit breakers shall be furnished with lock-on hardware and shall be identified with red marking as a fire alarm circuit. The location of the circuit disconnecting means shall be permanently identified at the fire alarm control unit.

C. All wiring shall be installed in strict compliance with all the provisions of NEC - Article 760 Parts I and III, Power-Limited Fire Protective Signaling Circuits or if required may be reclassified as non-power limited and wired in accordance with NEC-Article 760 Parts I and II.

D. All wiring shall be installed in strict compliance with pathway survivability requirements of applicable codes including NFPA 72.

E. Upon completion, the contractor shall so certify in writing to the owner and general contractor.

F. Front surface of all junction box covers in concealed areas (such as above lay-in ceilings) or within mechanical/electrical rooms (and other similar areas where appearance of boxes is not an issue) shall be sprayed red and labeled "Fire Alarm" or “F/A”. Covers in exposed areas shall be labeled “F/A” on interior of front cover. Wiring color code shall be maintained throughout the installation.

G. All fire alarm wiring shall be installed in conduit. Conduit shall be sized per manufacturer’s recommendations, but in no case shall conduit be smaller than 3/4”.

H. Installation of equipment and devices that pertain to other work in the contract shall be closely coordinated with the appropriate subcontractors.

I. All raceways shall be concealed unless specifically shown or approved otherwise.

J. The contractor shall clean all dirt and debris from the inside and the outside of the fire alarm equipment after completion of the installation.

K. Install System Record Document cabinet adjacent to control panel unless alternate location is approved.

L. The manufacturer's authorized representative shall provide on-site supervision of installation and shall provide all system setup and programming services.

M. The manufacturer’s authorized representative shall have as a minimum, a NICET LEVEL III certification. The fire alarm contractor shall have a technician with a minimum Nicet Level III certification working in a position of responsibility. All technicians working for the certified contractor shall have a minimum Nicet Level II certification. Any fire alarm contractor wishing to bid on the fire alarm work shall show evidence of certifications at the pre-bid conference.

N. The fire alarm contractor shall be licensed as a certified fire alarm contractor by the state in which the work is to be performed in compliance with all requirements of state fire marshall or other AHJ’s as applicable.

O. The drawing/specifications included herein are to indicate contract intent only. The Fire Alarm contractor shall provide final design documents to include plans specifying exact device types/locations, circuitry, battery calculations, circuit/voltage drop calculations, etc. in accordance with all applicable code requirements. These final design documents shall be prepared under the supervision of an engineer licensed in the state where the work is to be performed, engaged/employed by the Fire Alarm contractor, and must bear the engineer’s licensure seal with signature and date.

3.2 TESTING

A. The completed fire alarm system shall be fully tested in accordance with NFPA-72H by the contractor in the presence of the owner's representative and the Local Fire Marshal. Upon completion of a successful test, the contractor shall so certify in writing to the owner and general contractor, and shall submit final testing results with O&M documentation..

B. The contractor shall test and demonstrate proper operation of all smoke detection equipment and associated HVAC controls to the satisfaction of the authority-having-jurisdiction and fire marshal.

3.3 WARRANTY

A. The contractor shall warrant the completed fire alarm system wiring and equipment to be free from inherent mechanical and electrical defects for a period of one (1) year from the date of the completed and certified test or from the date of first beneficial use.

B. The equipment manufacturer shall make available to the owner a maintenance contract proposal to provide a minimum of two (2) inspections and tests per year in compliance with NFPA-72H

guidelines.

3.4 CERTIFICATION & ACCEPTANCE

A. A factory trained representative of the manufacturer shall supervise final testing of the system in accordance with N.F.P.A. Standard 72H-1984 in the presence of a representative of the authority having jurisdiction. Manufacturer's representative shall be NICET trained and shall have a level III NICET certificate. It shall be subject to the approval and acceptance of the responsible engineer. On completion of the acceptance tests, the Owner or his representative shall be instructed in the operation and testing of the system.

B. The fire alarm system shall be free from defects in workmanship and materials, under normal use and service, for a period of one year from the date of acceptance or beneficial occupancy whichever is earlier. Any equipment shown to be defective in workmanship or material shall be repaired, replaced, or adjusted free of charge.

C. The equipment manufacturer shall be represented by a local service organization, and the name of this organization shall be furnished to the Architect and Owner. The service organization shall be located within 50 miles of the job site. The service organization shall furnish, gratis to the Owner, a one year maintenance warranty contract, effective from the date of final acceptance.

END OF SECTION 28 31 00

SECTION 28 78 00

EMERGENCY RESPONDER RADIO COVERAGE SYSTEM

PART 1 - GENERAL

1.1 INITIAL RADIO SIGNAL SURVEY (INCLUDE IN BASE BID)

A. Include all costs in base bid for the Fire Alarm Contractor to conduct a radio signal survey immediately after building structure is complete, and prior to ceiling installation to determine signal coverage and strength of the municipality's emergency responder radio (public safety) system inside the project facility.

B. Conduct a survey using a RF Spectrum Analyzer, a calibrated, system-compatible radio or another suitable instrument with traceable certificate of calibration to analyze the RF signal strength. Both inbound and outbound signal strength shall be determined, measured, calculated and documented as required by code and AHJ. Survey shall be performed by FCC GROL certified technicians. Survey shall include measurements at a minimum of 20 readings per floor or 1,600SF if the floor area exceeds 32,000SF and in all critical areas or as otherwise directed by AHJ.

C. Survey report and drawing indicating measurements at each frequency band of interest shall be submitted to the AHJ for review. The report shall clearly indicate all areas that do not meet a minimum of -95dBm nominal uplink or downlink signal at 100% or a Delivered Audio Quality (DAQ) of 3.0.

D. If measured levels determined to be insufficient, a complete Emergency Responder Radio Coverage (ERRC) system shall be provided in accordance with these specifications below. Cost for the system and installation will be paid through allowance.

E. Contractor shall be responsible for scheduling survey so that all of the following is completed prior to the installation of ceilings:
1. Conduct initial survey
2. Submit survey results and report to the AHJ for review and determination of system requirements
3. Provide system design and submit shop drawings to architect and AHJ for review

1.2 SCOPE (SEE ALLOWANCES)

A. The contractor shall design, furnish, install, and warranty a complete Emergency Responder Radio Coverage (ERRC) system. The installed system shall include all hardware, bi-directional amplifiers, band-pass filters, surge suppressors, lightning protection, UPS, transmission lines, power cabling, antennas, and other components necessary for a complete operational system as specified and as acceptable to the local authorities having jurisdiction.

B. Equipment manufacturer name and model numbers specified are provided to establish quality of equipment and system operational features. Any proposed substitution of equipment from that specified must be approved by the Architect within ten (10) days prior to bid date.

C. The entire system shall be guaranteed for a period of one (1) year from the date of final

acceptance of the installation and the Contractor shall repair or replace defective equipment, during this period, at no cost to the owner.

D. Entire system shall be verified and approved by local AHJ to comply with all emergency responder radio network requirements including signal strength and frequency range.

1.3 DEFINITIONS

A. BDA: Bi-Directional Amplifier is a two-way signal booster that is used to amplify band-selective or multi-band RF signals in the uplink, to the base station and in the downlink from the base station to subscriber devices for enhanced signals and improved coverage.

B. DAS: Distributed Antenna System is a network of separate antenna nodes connected to a common transport medium.

C. ERRC: Emergency Responder Radio Coverage System is a complete in-building radio communication system that brings wireless signals into a structure from outside, amplifies those signals with a signal booster (BDA), and then evenly distributes the amplified signals throughout a structure via a Distributed Antenna System (DAS). The system also amplifies signals originating inside the building and transmits them outside.

D. Donor Antenna: Antenna that receives and transmits signal to radio system outside of facility.

1.4 STANDARDS

A. The system shall comply with all requirements of the latest edition of each of the following codes and standards. The latest edition of these codes and standards form a part of this specification:
1. U.L. Standard 2524.
2. International Fire Code Section 510
3. NFPA 1221
4. NFPA 72
5. All requirements of local Fire Department, Building Department and all other authorities having jurisdiction (AHJ)

1.5 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: For headend and distribution system. Include plans, elevations, sections, details and attachments to other work.
1. Show fabrication and installation details for equipment.
2. Functional Block Diagram: Show single-line interconnections between components for headend and distribution system. Show cable types and sizes.
3. Dimensioned Plan and Elevations of Headend Equipment: Show access and workspace requirements.
4. Wiring Diagrams: For power, signal, and control wiring and transmission cable, include cross connects, taps, and other connections cords.

C. Design Calculations: Calculate signal attenuation budget and show calculated line and equipment losses for the system based on the functional block diagram, to show that proposed

system layout can be expected to perform up to specification. Calculate signal strength from sources to endpoints. Allowable losses between components and user interface shall be used to determine size and type of cable.

D. Coordination Drawings: Include dimensioned plan and elevation views of components and enclosures. Show access and workspace requirements.

E. Equipment List: Include each piece of equipment and include model number, manufacturer, serial number, location, and date of original installation. Insert testing record of each piece of adjustable equipment, listing name of person testing, date of test, and description of as-left set points.

F. Field quality-control reports.

G. Operation and Maintenance Data: For headend and distribution system to include in emergency, operation, and maintenance manuals.

H. Contract shall submit set of all drawings and product data to permitting agencies as required. These final design documents shall be prepared under the supervision of an engineer licensed in the state where the work is to be performed, engaged/employed by the system vendor, and must bear the engineer's licensure seal with signature and date.

I. Any permits necessary for the installation of the work shall be obtained prior to the commencement of the work. All permit costs and inspection fees shall be included.

PART 2 - PRODUCTS

2.1 RADIO FREQUENCY (RF) BDA-BASED SIGNAL BOOSTER SYSTEMS

A. In-building signal booster systems shall receive and re-transmit the entire uplink/downlink frequency band utilized by the regional emergency service provider(s)**.** The contractor shall confirm with the regional emergency service provider(s) as to the specific frequencies used by the various agencies. This system shall be state-of-the-art, operating bi-directionally and in full duplex. The system shall be fully compatible with and function on Locality's Public Safety Radio System.

B. BDA shall be capable of providing in building coverage for all the cellular networks as identified by the owner.

C. Signal boosters (BDA)
1. Shall have Nema Type 4 enclosure
2. Shall be UL2524 listed
3. Shall be FCC certification.
4. Provide standby battery system capable of maintaining the system operational for a minimum of 12 hours or 2 hours if supplied by emergency generator circuit. Batteries system shall be completely enclosed in Nema Type 4 enclosure.
5. Signal Boosters shall have oscillation suppression circuitry to protect the public safety radio system in case of system malfunction or other causes. The oscillation suppression circuit shall not disable the system operation. Systems that automatically disable the signal booster upon oscillation detection shall not be allowed

6. Signal Boosters shall have uplink noise suppression function to eliminate uplink noise while in standby (i.e. no radio transmission from within a building).
7. Include relays as required for monitoring system with fire alarm system.

D. DAS Antennas shall be architectural, dome or flush type where located in public areas. Stick type antennas are acceptable where located in back-of-house spaces. Finish shall be white unless directed otherwise by architect in submittal review.

E. A dedicated supervised monitoring panel shall be provided next to the fire alarm panel / annunciator or other location as designated by AHJ to annunciate the status of all signal booster locations. The monitoring panel shall provide visual and labeled indication of the following for each signal booster:
1. Normal AC power
2. Signal booster trouble
3. Antenna Failure
4. Loss of normal AC power
5. Failure of battery charger
6. Low battery capacity

F. Completed installations (including cabling) shall comply with all applicable codes and standards, including County Building and Electrical Codes, NFPA, ANSI, NEC, OSHA, EIA, IEEE, R-56, etc., as well as the FCC Rules and Regulations, as applicable. Equipment provided shall be UL listed and FCC type accepted for this specific application. Compliance to codes and standards shall extend to include proper grounding, bonding and surge.

G. All cabling shall be plenum rated.

H. All vertical riser cabling shall be 2-hour rated.

2.2 DESIGN REQUIREMENTS:

A. The system shall provide digital signal strength coverage over 95% area on each floor/level of the equipped building, or in specific areas defined by Locality in a Scope of Work document for a particular building or site. Critical areas shall have 99% floor area coverage.

B. Systems shall provide a minimum digital and analog overage of Circuit Merit (CM) 3 and Delivered Audio Quality (DAQ) 3.0, with a reliability factor of 95%.

C. Antenna isolation shall be maintained between the donor antenna and all inside antennas (D.A.S.) to a minimum of 20dB under all operating conditions

D. A Coverage Acceptance Test shall be executed prior to final acceptance of an installed system. Coverage acceptance testing shall be based on audio quality performance in evenly spaced test grids in the defined service areas. A minimum of 20 tests will be taken per floor/level. Total number of test grids will be determined by the Owner, based on the size of the space per floor/level.

E. Design and appearance will be of “finished” construction, i.e. shall be concealed and/or unobtrusive in finished areas. DAS antennas shall be located in back-of-house areas where possible. If required to be located in visible public aeras, antennas shall be architectural, low-

profile type and located in corridors where possible. Unless indicated otherwise, wire mold and surface conduit installations will not be acceptable unless approved in writing by the Architect in advance.

2.3 MANUFACTURER

A. Equipment shall be as manufactured by Simplex, Notifier or EST or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Wiring shall be in strict accordance with the National Electrical Code and all state and local regulations. Wiring shall be installed in accordance with manufacturer's wiring diagrams and shall test free from ground, opens and short circuits.

B. All connections shall be made under the direct supervision of a qualified technician.

C. Contractor shall provide dedicated power circuits as required for system operation. Where an emergency distribution system is provided, radio coverage system power shall be connected to the emergency branch.

D. All vertical riser cabling shall be installed in conduit within a 2-hour fire rated enclosure.

E. All copper circuits routed between or outside of buildings shall be provided with a surge protection device at each end.

F. Securely mount donor antenna on roof and aim towards direction of public safety city repeater antenna. All mounting and penetrations shall be coordinated with roofing contractor.

G. Contractor shall provide all devices and cabling as required to monitor system with building Fire Alarm System in accordance with all applicable code requirements.

H. Refer to Specification Section 27 05 00 for additional installation requirements.

I. During initial installation, each system shall be optimized to perform in accordance with the specifications set forth in the system design, manufacturer's specifications and FCC regulations. The contractor shall ensure that uplink and downlink levels are properly set and consistent with design expectations. The contractor shall further ensure that noise and spurious products are held within limits set forth in the system design, manufacturer's specifications and FCC regulations. Prior to system acceptance, for each active BDA, booster amplifier, etc., the contractor shall submit a Proof of Performance certification, that lists the design expectations, actual measurements, and if applicable, FCC specifications for the following parameters:
   1. Worst case BDA uplink input level, in dBm.
   2. Worst case BDA uplink output level, in dBm.
   3. BDA downlink input level, in dBm.
   4. BDA downlink output level, in dBm.
   5. Noise and spurious products, BDA uplink output, in dBc.
   6. Noise and spurious products, BDA downlink output, in dBc.

J. The original Proof of Performance report shall be submitted to Owner's project manager, and a copy of the Proof of Performance report shall be affixed to its associated equipment.

3.2 WARRANTY

A. The contractor shall provide a full one-year warranty to cover installation and all equipment, software, and components; the warranty shall commence upon the Owner's final acceptance of the facility. Under warranty coverage, the successful contractor shall provide same business day response time for system malfunctions.

B. The contractor shall perform optimization of each system during the initial warranty period, sixty (60) to ninety (90) days prior to warranty expiration. This optimization task is separate from the initial optimization performed during system installation. The contractor shall include pricing for annual system optimization to be included as part of post-warranty maintenance. Actual scope of work for annual optimization and maintenance will vary on a case-by-case basis, but typically will consist of the following:
1. Optimize the system to perform in accordance with the specifications set forth in the system design, manufacturer's specifications and FCC regulations.
2. Ensure that uplink and downlink levels are properly set and are consistent with design specifications.
3. Ensure that noise and spurious products are held within limits set forth in the system design, manufacturer's specifications and FCC regulations.

C. Update the Proof of Performance records for the system, listing the design expectations, actual measurements, and if applicable, FCC specifications for the following parameters:
1. Worst case BDA uplink input level, in dBm.
2. Worst case BDA uplink output level, in dBm.
3. BDA downlink input level, in dBm.
4. BDA downlink output level, in dBm.
5. Noise and spurious products, BDA uplink output, in dBc.
6. Noise and spurious products, BDA downlink output, in dBc.

D. The updated Proof of Performance report shall be submitted to the Owner, and a copy of the updated Proof of Performance report shall be affixed to its associated equipment.

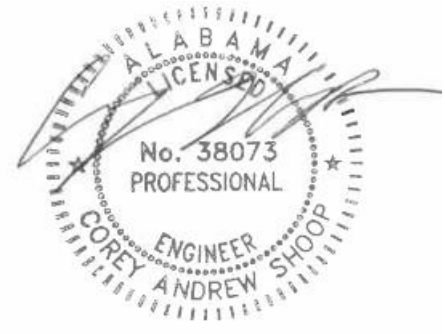
E. Visually inspect outside antenna installation. Correct any issues found with the antenna mounting hardware, grounding system, or outside cabling.

F. Visually inspect inside BDA or booster amplifier equipment installation. Correct any issues found with RF cabling, electrical connection, or equipment mounting.

G. Clean equipment fans, filters and other ventilation system components.

H. Inspect and replace any defective indicator lights.

I. Test battery system performance for proper fallback to battery power and the duration of battery operation.



J. Test fault reporting system for proper operation and reporting of system faults.

K. Submit a written Preventive Maintenance Report to the Owner, listing the results of the optimization and preventive maintenance effort. The report shall include the Proof of Performance report for active RF components, and details of any other discrepancies found and corrective actions taken.

L. All as-built drawings shall be submitted to the Owner at completion, which shall include antenna system layout and all associated hardware, along with specification sheets. Include RF measurements taken.

END OF SECTION 28 78 00

This page intentionally left blank

4/27/2026

Applicable for Sections: 02 4100, 31 1000, 31 2000, 31 2500, 32 1216, 32 1313, 32 1613, 32 1723, 33 1000, 33 3000 and 33 4001

SECTION 31 1000

SITE CLEARING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Related work specified elsewhere includes Sections:
.. Section 31 2000 - “Earth Moving”
.. Section 02 4100 - “Demolition”

1.2 SUMMARY

A. This Section includes the following:

1. Protection of existing trees and landscaping to remain, if any, and boundary and property line markers, bench marks, survey control points, and existing structures and improvements which are to remain.

2. Environmental and erosion control measures, as indicated and as otherwise required by applicable codes, regulations, and authorities having jurisdiction.

3. Removal of trees and other vegetation, as indicated, and within “controlled areas.”

4. Topsoil stripping, and stockpiling, as indicated, and within “controlled areas.”

5. Removing above-grade improvements as indicated, and as required to accommodate new construction.

6. Removing below-grade improvements as indicated, and as required to accommodate new construction.

1.3 PROJECT CONDITIONS

A. Traffic: Conduct site clearing operations to ensure minimum interference with roads, streets, walks, and other adjacent occupied or used facilities. Do not close or obstruct streets, walks or other occupied or used facilities without permission from authorities having jurisdiction, unless specifically indicated elsewhere in contract documents.

B. Protection of Existing Improvements:

1. Provide protection necessary to prevent damage to existing improvements indicated to remain in place. Clearing, demolition and any excavation within 5'-0" of existing buildings and structures to remain shall be performed by hand.

2. Protect improvements on adjoining properties and on Owner's property.

3. Protect boundary and property line markers, bench marks, and survey control points.

4. Restore damaged improvements and markers to their original condition, as acceptable to property owners.

PART 2 - PRODUCTS

A. Not applicable to this Section.

PART 3 - EXECUTION

3.1 SITE CLEARING

A. General:

1. Remove trees, shrubs, grass and other vegetation, improvements, or obstructions as required to permit installation of new construction. Remove similar items elsewhere on site or premises as specifically indicated.

B. Topsoil:

1. Topsoil is defined as friable clay loam surface soil found in a depth of not less than 6 inches. Satisfactory topsoil is reasonably free of subsoil, clay lumps, stones, and other objects over 2 inches in diameter, and without weeds, roots, and other objectionable material.

2. Strip topsoil to whatever depths encountered in a manner to prevent intermingling with underlying subsoil or other objectionable material.

   a. Remove heavy growths of grass from areas before stripping.

3. Stockpile topsoil in storage piles in areas as indicated or directed. Construct storage piles to provide free drainage of surface water. Cover storage piles, as required, to prevent wind erosion, or seed and mulch if left undisturbed for a period of time greater than 14 consecutive days.

4. Legally dispose of off-site unsuitable soil, excess topsoil not to be stockpiled, and waste material debris.

5. Fill depressions caused by site clearing operations with satisfactory soil material, unless further excavation or earthwork is indicated.

   a. Place fill material in horizontal layers not exceeding 8 inches loose depth, and thoroughly compact to a density equal to adjacent original ground, unless specific compaction is otherwise indicated in Section 31 2000 "Earth Moving", or, as directed in the geotechnical investigation.

3.2 DISPOSAL OF WASTE MATERIALS

A. Burning on Owner's Property: Burning will not be permitted on Owner's property.

B. Removal from Owner's Property: Remove waste materials, trash and debris, and legally dispose of same off site.

END OF SITE CLEARING

SECTION 31 2000

EARTH MOVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Related work specified elsewhere includes:

.. Section 01 2200 - "Unit Prices"
.. Section 01 7800 - "Closeout Submittals"
.. Section 02 3213 – "Subsurface Investigation"
.. Section 31 1000 - "Site Clearing", "Report of Geotechnical Investigation"
.. Section 32 1313 - "Concrete Paving"
.. Section 03 3100 - "Concrete"
.. Division 26 - "Electrical"

1.2 SUMMARY

A. This Section includes unclassified excavation, grading and fill as follows:

1. Preparing of subgrade for building slabs, walks, and pavements; and additional work indicated on the Drawings and in the Project Manual.

a. Comply with recommendations in the Owner's "Report of Geotechnical Exploration", this Section, and other Division 31 Sections; Refer also to Civil and Structural Drawings for additional information and requirements.

b. Undercutting of building area as indicated in the Report of Geotechnical Investigation and in the Contract Documents.

c. Perform excavation by hand within 5'-0" of existing buildings and structures to remain. Design and provide all necessary supports, shoring, etc., as required to prevent settlement, collapse, and/or other damage to existing buildings and structures to remain.

1) DO NOT EXCAVATE BELOW THE EFFECTIVE BEARING AREA OF FOUNDATIONS OF EXISTING BUILDINGS AND STRUCTURES. In the event of conflict during construction, notify Architect prior to proceeding with work in the effected area.

d. Compaction of backfill at any basement and below grade walls shall only be by hand-directed compaction equipment. Heavy construction equipment and/or

heavy trucks shall not be allowed within 10-feet of any basement walls, and within 5-feet of foundation walls.

2. Drainage fill course (porous fill) for support of building slabs is included as part of this work; compacted in place.

3. Excavating and backfilling of trenches within building control areas and on site.

4. Stripping and stockpiling of topsoil (if any) is specified in Section 31 1000 - Site Clearing.

5. The extent of earthwork is indicated on the Drawings. This earthwork is to be included in the base bid as unclassified excavation, regardless of material encountered.

6. Removal of existing improvements may also be specified under various Division 31 Sections.

B. Excavating and Backfilling for Plumbing, HVAC, and Electrical Work: Refer to Divisions 22, 23, and 26 sections for excavation and backfill required in conjunction with underground mechanical and electrical utilities and buried mechanical and electrical appurtenances, not work of this Section.

1. However, construction materials and execution for Plumbing, HVAC, and Electrical work shall comply with requirements of this Section, and related Division 31 Sections, when the work and/or materials required are not indicated or only partially indicated in Divisions 22, 23, and 26.

C. Placement and compaction of at least 4-inches of topsoil up to finish grades is included in the work of this Section.

1. Allow for thickness of topsoil and sod.
2. Refer to Division 32 sections for topsoil composition and placement requirements.

1.3 DEFINITIONS

A. “Excavation” consists of removal of materials and existing improvements encountered to subgrade elevations indicated, and subsequent disposal of materials removed.

B. “Unauthorized” excavation consists of removal of materials beyond indicated subgrade elevations or dimensions without specific direction of Owner’s Geotechnical Engineer. Unauthorized excavation, as well as remedial work directed by Owner’s Geotechnical Engineer, shall be at Contractor’s expense.

1. Under footings, foundation bases, or retaining walls, fill unauthorized excavation by extending indicated bottom elevation of footing or base to excavation bottom, without altering required top elevation. Lean concrete fill may be used to bring elevations to proper position, when acceptable to Owner’s Geotechnical Engineer.

2. In locations other than those above, backfill and compact unauthorized excavations as specified for authorized excavations of same classification, unless otherwise directed by Owner's Geotechnical Engineer.

C. "Additional Excavation": When excavation has reached required subgrade elevations, notify Owner's Geotechnical Engineer, who will make an inspection of conditions. If Owner's Geotechnical Engineer determines that bearing materials at required subgrade elevations are unsuitable, continued excavation may be required. If additional excavation is required, replace excavated material as directed by Owner's Geotechnical Engineer.

1. The Contract Sum will be adjusted by Change Order, or as provided in General Conditions, for additional excavation, measured in place (Bank Measure), and its replacement appropriately authorized in writing prior to beginning the work, and for which the Contractor is due payment from the Owner.

D. "Subgrade": The undisturbed earth or the compacted soil layer immediately below pavement base course, select drainage fill, bottom of indicated undercut areas, or topsoil materials.

E. "Structure": Buildings, foundations, slabs, tanks, curbs, or other man-made stationary features occurring above or below ground surface.

F. "Building Control Area" and/or "Controlled Area": Below and at least 10-feet beyond building foot print or exterior walls, and below roofs, to include covered porches and canopies, and below and at least 5-feet beyond all walks and pavements subject to bearing vehicular traffic.

G. "Mud Footings" (if any): The at least 2-inches to 4-inches of lean 2,500 psi (minimum) concrete placed in the bottom of footing and foundation trenches and excavations, which is required if permanent or structural concrete cannot be placed the same day they are excavated.

1. Unless mud footings are indicated on Structural Drawings, their depth shall be compensated for by over-excavation.

2. Mud footings (if any) shall be completely clean prior to placement of any reinforcing and/or permanent or structural concrete.

3. Refer to the Owner's "Geotechnical Investigation" Report, and Structural Drawings for additional information and requirements for other "mud footings" (or "mud mats", or "mud seals").

H. Rock: Rock material in beds, ledges, unstratified masses, and conglomerate deposits and boulders of rock material exceeding 1 cu. yd. (0.76 cu. m) for bulk excavation or 3/4 cu. yd. (0.57 cu. m) for footing, trench, and pit excavation that cannot be removed by rock excavating equipment equivalent to the following in size and performance ratings, without systematic drilling, ram hammering, ripping, or blasting, when permitted:

1. Excavation of Footings, Trenches, and Pits: Late-model, track-mounted hydraulic excavator; equipped with a 42-inch- (1065-mm-) wide, short-tip-radius rock bucket; rated at not less than 120-hp (89-kW) flywheel power with bucket-curling force of not

less than 25,000 lbf (111 kN) and stick-crowd force of not less than 19,000 lbf; measured according to SAE J-1179.

2. Bulk Excavation: Late-model, track-mounted dozer equipped with a single tooth ripper; rated at not less than 250-hp flywheel power and developing a minimum of 45,000-lbf (200-kN) breakout force; measured according to SAE J-732.

3. Refer to "Owner's Report of Geotechnical Exploration" for additional information regarding recommendations when rock is encountered.

1.4 SUBMITTALS

A. Test Reports: Submit the following reports directly to Architect, Civil Engineer, Structural Engineer, and the Owner, directly from the testing service, with copy to Contractor:

1. Test reports on fill and borrow material.

2. Verification of suitability of each foundation, floor slab and subgrade condition and material, in accordance with specified requirements.

3. Field reports; and in-place soil density tests.

1.5 QUALITY ASSURANCE

A. Codes and Standards: Perform excavation work on site and in right-of-ways in compliance with applicable requirements of authorities having jurisdiction.

B. Testing and Inspection Service: All required soil testing and inspection services during earthwork operations shall be performed by a qualified independent geotechnical testing laboratory.

1. Refer to Section 01 0150 - "Special Conditions", for additional information and requirements.

1.6 PROJECT CONDITIONS

A. Site Information: Refer to Section 31 1000 - "Site Clearing", and Civil Drawings, for additional information and recommendations.

B. Existing Utilities: Locate existing underground utilities in areas of excavation work. If utilities are to remain in place, provide adequate means of support and protection during earthwork operations in the vicinity, and as may also be required for other construction work.

1. Notify the Alabama Line Location Center at 1-800-292-8525 at least 2-full working days (48 hours), excluding weekends and holidays, prior to any excavation work. This organization will contact its member utility companies to locate and mark all of their own underground facilities.

a. Notify non-member companies directly, for them to perform this service.

2. Should uncharted, or incorrectly charted, piping or other utilities be encountered during excavation, consult utility owner immediately for directions and record locations on as-built record drawings. Cooperate with Owner and utility companies in keeping respective services and facilities in operation. Repair damaged utilities to satisfaction of utility owner.

3. Do not interrupt existing utilities serving facilities occupied by Owner or others, during occupied hours, except when permitted in writing by Architect and then only after acceptable temporary utility services have been provided.

   a. Provide minimum of 48-hour notice to Owner and copy Architect, and receive written notice to proceed before interrupting any utility.

4. Demolish and completely remove from the site any existing underground utilities to be removed, and all existing underground utilities in "controlled areas". Coordinate with utility companies for shutoff of services if lines are active.

C. Use of Explosives: **Use of explosives *is not* permitted.**

D. Protection of Persons and Property:

1. Barricade open excavations occurring as part of this work and post with warning lights.

2. Operate warning lights as recommended by authorities having jurisdiction.

3. Comply with requirements of current regulations of OSHA, applicable Codes, ordinances, and authorities having jurisdiction.

4. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by earthwork operations.

5. Perform excavation by hand within 5'-0" of existing buildings and structures to remain, and within dripline of large trees to remain. Protect root systems from damage or dryout to the greatest extent possible. Maintain moist condition for root system and cover exposed roots with moistened burlap. Paint root cuts of 1-inch and larger with emulsified asphalt tree paint.

   a. Do not under-mine or excavate below footings and/or foundations which are to remain.

PART 2 - PRODUCTS

2.1 SOIL MATERIALS - DEFINITIONS

A. Satisfactory soil materials are defined as clean, non-saturated, non-organic sections of earth taken from acceptable sources, and complying with ASTM D2487 soil classification groups included in recommendations of the Owner's "Report of Geotechnical Exploration", or if not included, as directed at the time of earthwork operations and/or acceptance resulting from acceptable test results obtained on soil materials proposed by the Contractor and tested by the project Geotechnical Engineer, as required by the Bid and Contract Documents.

Liquid Limit (LL)	**Less than 50%**
Plasticity Index (PI)	**Less than 25%**
Maximum Dry Density (ASTM D-698)	**Greater than 100 pcf**
Maximum Particle Size	**3 inches or less**
Organic Matter	**Less than 5%**

B. Unsatisfactory soil materials are defined as those complying with ASTM D2487 soil classification groups other than those indicated above.

C. Drainage Fill (or "porous fill" or "drainage aggregate"): Clean, washed, evenly graded mixture of free-draining pea gravel, coarse sand, or crushed stone, with not more than 50 percent passing a No. 50 sieve and not more than 5 percent passing a No. 200 sieve, and subject to approval by the project geotechnical engineer and testing laboratory; **Minimum 4-inches compacted completed thickness.**

D. Backfill and Fill Materials (Grassed areas only; Cuts and fills outside "controlled areas", during general grading): Satisfactory soil materials from on-site excavations, free of clay, rock or gravel larger than 2-inches in any dimension, debris, waste, frozen materials, vegetation and other deleterious material.

1. All fill soils must be compatible with existing soils, so they can bond together.

E. Topsoil: Refer to Section 31 1000 - "Site Clearing."

F. Rock Fill: Refer to Owner's "Report of Geotechnical Investigation" for recommendations regarding placement and compaction requirements.

PART 3 - EXECUTION

3.1 PROOFROLLING

A. Areas throughout significant slopes and beneath and 10'-0" beyond new building and covered areas, and beneath and 5'-0" beyond new pavement areas (back-of-curb or other paving edge termination) shall be designated as "controlled areas." Prior to placement of fill earth and

following removal of cut earth, the controlled areas shall be proofrolled. Areas to be filled shall be proofrolled prior to any fill placement; cut areas shall be proofrolled after they are brought to subgrade level. Proofrolling shall be performed with a loaded tandem axle dump truck or similar approved equipment. The proofroller shall make at least two passes over each section in perpendicular directions over the "controlled areas". If any areas fail the proofroll, repair these areas as directed by the Owner's Geotechnical Engineer.

1. Proofrolling shall be conducted in the presence of testing lab's Geotechnical Engineer.

2. Do not proofroll when the ground surface is wet or saturated with water.

3.2 EXCAVATION

A. Earth Excavation includes excavation of pavements and other obstructions visible on surface; underground structures, utilities, and other items indicated to be demolished and removed; together with earth and other materials encountered that are not classified as structures, foundations, rock or unauthorized excavation.

B. Perform excavation by hand within 5'-0" of existing buildings and structures to remain.

1. Do not under-mine or excavate below footings and/or foundations which are to remain.

C. Refer to "Definitions" paragraph above for any "mud footings" required.

3.3 STABILITY OF EXCAVATIONS

A. General: Comply with local codes, ordinances, and requirements of agencies having jurisdiction.

B. Slope sides of excavations to comply with local codes, ordinances, and requirements of agencies having jurisdiction. Shore and brace where sloping is not possible because of space restrictions or stability of material excavated. Maintain sides and slopes of excavations in safe condition until completion of backfilling.

C. Shoring and Bracing: Provide materials for shoring and bracing, such as sheet piling, uprights, stringers, and cross braces, in good serviceable condition. Maintain shoring and bracing in excavations regardless of time period excavations will be open. Extend shoring and bracing as excavation progresses.

3.4 DEWATERING

A. Prevent surface water and Geotechnical or ground water from flowing into excavations and from flooding project site and surrounding area.

1. Do not allow water to accumulate in excavations. Remove water to prevent softening of foundation bottoms, undercutting footings, and soil changes detrimental to stability of subgrades and foundations. Contractor to provide and maintain, at their expense,

pumps, well points, sumps, suction and discharge lines, and other dewatering system components necessary to convey water away from excavations.

2. Establish and maintain temporary drainage ditches and other diversions outside excavation limits to convey rain water and water removed from excavations to collecting or runoff areas. Do not use trench excavations as temporary drainage ditches.

3. Due to the types of soil that exist on site, seepage and/or springs may occur. If excessive seepage or springs are discovered, notify Owner's Geotechnical Engineer and Architect immediately.

3.5 STORAGE OF EXCAVATED MATERIALS

A. Stockpile excavated materials acceptable for backfill and fill only within the limits of the area under construction. No stockpiling will be allowed in areas that are not under construction. If there is not room for stockpiling, then the contractor will be responsible for legally disposing of the material and will not get additional compensation for the replacement of that material if fill is needed. Place, grade, and shape stockpiles for proper drainage.

1. Locate and retain soil materials away from edge of excavations.

2. Dispose of excess excavated soil material by removal and legal disposal off-site.

3.6 EXCAVATION FOR STRUCTURES

A. Conform to elevations and dimensions shown within a tolerance of plus or minus 0.10 foot, and extending a sufficient distance from footings and foundations to permit placing and removal of concrete formwork, installation of services, and other construction and for inspection.

1. Excavations for Footings and Foundations: Do not disturb bottom of excavation. Excavate by hand to final grade just before concrete reinforcement is placed. Trim bottoms to required lines and grades to leave solid base to receive other work.

2. Excavation for Underground Tanks, Basins, and Mechanical or Electrical Structures: Conform to elevations and dimensions indicated within a tolerance of plus or minus 0.10 foot; plus, a sufficient distance to permit placing and removal of concrete formwork, installation of services, and other construction and for inspection. Do not disturb bottom of excavations, intended for bearing surface.

3. The contractor shall include in the base bid the cost of the volume of undercut and removal of existing material within the building control area, building areas plus 10 feet, to an average depth of 3 feet below existing grade for a volume of 5,700 CY. If any additional undercut is required, the contractor shall be paid by unit price through an allowance according to Section 01 2100 "Allowances". The undercut will be replaced with acceptable structural fill properly compacted. All excess undercut will be disposed of off-site at the contractor's expense.

3.7 EXCAVATION FOR WALKS AND PAVEMENTS

A. Cut surface under pavements to comply with cross-sections, elevations and grades as indicated.

1. The contractor shall include in the base bid the cost of the volume of undercut and removal of existing material within the pavement control area, pavement areas plus 5 feet, to an average depth of 18 inches below existing grade, for a volume of 5,850 CY. If any additional undercut is required, the contractor shall be paid by unit price through an allowance according to Section 01 2100 “Allowances”. The undercut will be replaced with acceptable structural fill properly compacted. All excess undercut will be disposed of off-site at the contractor’s expense.

3.8 TRENCH EXCAVATION FOR PIPES AND CONDUIT

A. Excavate trenches to uniform width, sufficiently wide to provide ample working room and a minimum of 6-inches to 9-inches of clearance on both sides of pipe or conduit.

B. Excavate trenches and conduit to depth indicated or required to establish indicated slope and invert elevations and to support bottom of pipe or conduit on minimum of 4-inches of compacted “select fill” bedding. Beyond building perimeter, excavate trenches to allow installation of top of pipe below frost line.

C. Except as otherwise indicated, excavate for exterior water-bearing piping (water, steam, condensate, drainage, etc.) so top of piping is not less than 2'-0" below finished grade and/or paving.

D. Where rock or concrete is encountered, carry excavation 6" below required elevation and backfill with a 6" layer of dense graded crushed stone, prior to installation of pipe.

3.9 COLD WEATHER PROTECTION

A. Protect excavation bottoms against freezing when atmospheric temperature is less than 35 degrees F.

3.10 BACKFILL AND FILL

A. General: Place soil material in layers to required subgrade elevations, for each area classification listed below, using materials specified in Part 2 of this Section.

1. Under all areas, use satisfactory excavated or borrow material. Refer to Owner’s “Report of Geotechnical Exploration”, and this Section, for minimum testing requirements.

2. Under building slabs, use drainage fill material of compacted and finished depth indicated, or if not indicated, **at least 4-inches** compacted and completed thickness.

3. Backfill trenches with concrete where trench excavations pass within 18-inches of column or wall footings and that are carried below bottom of such footings or that pass under wall footings. Place concrete to level of bottom of adjacent footing.

   a. Concrete is specified in Division 3.

   b. Do not backfill trenches until inspections and any required testing have been made and backfilling is authorized by Architect based on test results. Use care in backfilling to avoid damage or displacement of pipe systems.

   c. Utility trenches shall be backfilled with acceptable borrow or dense graded aggregate in 6" loose lifts compacted with mechanical piston tampers to the project requirements. Open graded stone is not to be used as backfill.

B. Backfill excavations as promptly as work permits, but not until completion of the following:

1. Acceptance of construction below finish grade including, where applicable, dampproofing, waterproofing, etc.

2. Inspections, testing, approval, and recording locations of underground utilities have been performed and recorded.

3. Removal of concrete formwork, if any.

4. Removal of shoring and bracing, and backfilling of voids with satisfactory materials.

   a. Cut off temporary sheet piling driven below bottom of structures and remove in manner to prevent settlement of the structure or utilities, or leave in place if required.

5. Removal of trash and debris from excavation.

6. Permanent or temporary horizontal bracing is in place on horizontally supported walls, where necessary.

3.11 PLACEMENT AND COMPACTION - GENERAL

A. Ground Surface Preparation:

1. Remove vegetation, debris, unsatisfactory soil materials, obstructions, and deleterious materials from ground surface prior to placement of fills. Plow strip, or break up sloped surfaces steeper than 1-vertical to 4-horizontal so that fill material will bond with existing surface.

2. Prior to placement of fill earth and following removal of cut earth, the controlled areas shall be proofrolled. Areas to be filled shall be proofrolled prior to any fill placement; cut areas shall be proofrolled after they are brought to subgrade level. Proofrolling shall be performed with a loaded tandem axle dump truck or similar approved

equipment. The proofroller shall make at least two passes over each section in perpendicular directions over the "controlled areas". If any areas fail the proofroll, repair these areas as directed by the Owner's Geotechnical Engineer.

a. Proofrolling shall be conducted in the presence of testing lab's Geotechnical Engineer.

b. Do not proofroll when the ground surface is wet or saturated with water.

B. Place backfill and fill materials in layers not more than 8-inches in loose depth for material compacted by heavy compaction equipment, and not more than 4-inches in loose depth for material compacted by hand-operated tampers.

C. Before compaction, moisten or aerate each layer as necessary to provide optimum moisture content. Compact each layer to required percentage of maximum dry density or relative dry density for each area classification. Do not place backfill or fill material on surfaces that are muddy, frozen, or contain frost or ice.

D. Place backfill and fill materials evenly adjacent to structures, piping, or conduit to required elevations. Prevent wedging action of backfill against structures or displacement of piping or conduit by carrying material uniformly around structure, piping, or conduit to approximately same elevation in each lift.

E. General Fill Embankment Construction

1. Embankment construction shall commence at the toe of the proposed slope and continue upwards as additional fill is placed. The engineered fill placed shall be benched into the natural slopes.

2. The embankment is to be overfilled and then cut back to the required geometry to remove the uncompacted material that is usually present on the face of fill slopes.

3. The face of slopes shall be promptly vegetated according to the Erosion Control Plan, and the CBMPP to prevent erosion after construction. Prior to vegetation, 4" minimum topsoil or as directed by Division 32 sections, is to be placed and tracked in by a dozer moving up and down the slope to create horizontal track lines.

F. Rock Fill:

1. Rock Fill is not to be used unless acceptable to the Owner's Geotechnical Engineer. Break larger particles down to 3" or less and treat as soil fill.

G. Control soil and fill compaction, providing minimum percentage of density specified for each area classification indicated below. Correct improperly compacted areas or lifts as directed by Owner's Geotechnical Engineer if soil density tests indicate inadequate compaction.

1. Percentage of Maximum Density Requirements: Compact soil to not less than the following percentages of maximum density, in accordance with ASTM D 698 A:

a. Under structures, building foundations and slabs, and 10' beyond those perimeters, compact full depth of fill placement and scarify, moisture condition and re-compact in accordance with the recommendations made in the Owner's "Report of Geotechnical Exploration".

1) Cut areas shall be proof rolled prior to and during scarification efforts and observed by the Owner's Geotechnical Engineer.

b. Under steps, covered areas, sidewalks, mechanical/utility and in all "controlled areas", compact in accordance with the recommendations made in the Owner's "Report of Geotechnical Investigation".

c. Under pavements and at least 5-feet beyond (measured from back-of-curb or edge of paving, where occurs), remove loose soils as described in this and replace with suitable material that is compacted to 98% standard proctor.

d. Under lawn or unpaved areas beyond "controlled areas", compact each layer of backfill or fill material in accordance with the recommendations made in the Owner's "Report of Geotechnical Investigation".

e. On-site Borrow (where allowed): In accordance with the recommendations made in the Owner's "Report of Geotechnical Investigation".

f. Select and/or Structural Fill: In accordance with the recommendations made in the Owner's "Report of Geotechnical Investigation".

g. Porous Fill (drainage course): In accordance with the recommendations made in the Owner's "Report of Geotechnical Investigation".

2. Moisture Control:

a. Where subgrade or layer of soil material must be moisture conditioned before compaction, uniformly apply water to surface of subgrade or layer of soil material. Apply water in minimum quantity as necessary to prevent free water from appearing on surface during or subsequent to compaction operations.

b. Remove and replace, or scarify and moisture condition, soil material that is too wet to permit compaction to specified density.

c. Stockpile or spread soil material that has been removed because it is too wet to permit compaction. Assist moisture conditioning by discing, harrowing, or pulverizing until moisture content is reduced to a satisfactory value.

d. At the time of densification, the moisture content of "engineered fill", "structural fill", and "select fill" should be within -3% to +3% of the materials' ASTM D-698 optimum moisture content.

e. Structural fill areas exposed to excessive wetting, drying or otherwise disturbed by the construction following acceptance for moisture and density should be retested followed by the correction of deficient areas just prior to the installation of additional fill or structures.

f. In no instance should placement of structural fill or ground supported structures be permitted if the ground surface soils contain a moisture content in excess of 2% of the material's optimum moisture content.

g. In no case shall porous drainage backfill (except as specifically indicated at foundation drains only) or masonry sand material be used adjacent to foundations. Care shall be taken to prevent masonry brick/block debris from falling or being pushed into foundation excavations.

3.12 GRADING

A. General: Uniformly grade areas within limits of grading under this section, including adjacent transition areas. Smooth finished surface within specified tolerances, compact with uniform levels or slopes between points where elevations are indicated or between such points and existing grades.

B. Grading Outside Building Lines: Grade areas adjacent to building lines to drain away from structures and to prevent ponding. Finish surfaces free from irregular surface changes and as follows:

1. Lawn or Unpaved Areas: Finish areas to receive topsoil to within not more than 0.10-foot above-or-below required subgrade elevations. Refer to Division 32 sections for topsoil requirements.

2. Walks: Shape surface of areas under walks to line, grade, and cross-section, with finish surface not more than 0.10-foot above-or-below required subgrade elevation.

3. Pavements: Shape surface of areas under pavement to line, grade, and cross-section, with finish surface not more than 1/2-inch above or below required subgrade elevation.

4. Connection of Existing and New Work: Provide flush transition, unless specifically indicated otherwise.

C. Grading Surface of Fill under Building Slabs and "Building Control Areas": Grade smooth and even, free of voids, compacted as specified, and to required elevation. Provide final grades within a tolerance of 1/2-inch when tested with a 10-foot straightedge.

D. Compaction: After grading, compact subgrade surfaces to the depth and indicated percentage of maximum or relative density for each area classification.

3.13 BUILDING SLAB DRAINAGE COURSE

A. General: Drainage course consists of placement of drainage fill material, in layers of indicated thickness, over subgrade surface to support concrete building slabs, sidewalks, pads, and below canopies and covered porches, and elsewhere as indicated.

1. Minimum Completed Thickness: 4-inches.

B. Placing: Place drainage fill material on prepared subgrade in layers of uniform thickness, conforming to indicated cross-section and thickness. Maintain optimum moisture content for compacting material during placement operations.

1. When a compacted drainage course is indicated to be 6-inches thick or less, place material in a single layer. When indicated to be more than 6-inches thick, place material in equal layers, except no single layer more than 6-inches or less than 3-inches in thickness when compacted.

3.14 FIELD QUALITY CONTROL

A. Quality Control Testing During Construction:

1. Allow testing service to inspect and approve each subgrade and fill layer before further backfill or construction work is performed.

2. Perform field density tests in accordance with ASTM D 698 (sand cone method), or acceptable ASTM methods or nuclear testing method, as applicable.

3. New Footing Subgrade: All foundation excavations shall be observed by the Project Geotechnical Engineer or his representative to verify required design bearing capacities of the bearing soils.

4. New Paved Areas, New Building Slab and “Building Control Areas” Subgrade: Perform at least one field density test of subgrade for every 5,000-square feet of fill area for each foot of vertical thickness of fill placed in “controlled areas”, with a minimum of one (1) test per lift.

5. Foundation Wall Backfill: Perform at least 2-field density tests at locations and elevations as directed.

6. Trenches: Perform at least one field density test for every 50-linear feet for each 8 inches of vertical thickness of fill placed in utility or similar trenches, which extend through the “controlled areas”.

   a. Retaining walls, if any, same as for “Trenches”, as indicated above.

7. A laboratory soil particle size, Atterberg limit, and Proctor moisture density relationship test shall be performed on each different type of fill soil used in the “controlled areas”.

8. Based on the Project Geotechnical Engineer’s testing reports, inspections, and recommendations, subgrade or fills that are below specified density, additional

earthwork, compaction, and/or other operations, and re-testing, shall be performed until specified density is obtained.

3.15 EROSION CONTROL

A. Provide erosion control methods in accordance with requirements of authorities having jurisdiction.

3.16 MAINTENANCE

A. Protection of Graded Areas: Protect newly graded areas from traffic and erosion. Keep free of trash and debris.

B. Repair and reestablish grades in settled, eroded, and rutted areas to specified tolerances.

C. Repair edges of existing pavements, sidewalks, etc., and other existing and/or new improvements flush with and to match existing materials and thicknesses, subject to acceptance by Owner and Architect.

D. Reconditioning Compacted Areas: Where completed compacted areas are disturbed by subsequent construction operations or adverse weather, scarify surface, reshape, and compact to required density prior to further construction.

E. Settling: Where settling is measurable or observable at excavated areas during general project warranty period, remove surface (pavement, lawn, or other finish), add backfill material, compact, and replace surface treatment. Restore appearance, quality, and condition of surface or finish to match adjacent work, and eliminate evidence of restoration to greatest extent possible.

3.17 DISPOSAL OF EXCESS AND WASTE MATERIALS

A. Removal from Owner’s Property:

1. Remove excess and waste materials, including unacceptable excavated material, trash, debris, and waste materials, and legally dispose of off Owner’s property.

END OF EARTHWORK

This page intentionally left blank

SECTION 31 2500

EROSION AND SEDIMENTATION CONTROL

PART 1 – GENERAL

1.1 SECTION INCLUDES

A. Temporary and permanent erosion control systems.

B. Slope Protection Systems.

1.2 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary and Division 1 Specification Sections, apply to this Section.

1. Section 31 1000 - Site Clearing
2. Section 31 2000 – Earth Moving
3. The Alabama Handbook for Erosion Control, Sediment Control and Stormwater Management on Construction Sites and Urban Areas, March 2022 edition or most recent edition.
4. Erosion and Sediment Control Plan

1.3 ENVIRONMENTAL REQUIREMENTS

A. The Contractor shall protect adjacent properties and water resources from erosion and sediment damage throughout the life of the contract.

1. The Contractor shall be responsible for the removal of sediments and debris escaping the project site, the remediation and/or repair of any damage that may occur as a result to adjoining and/or downstream affected properties or offsite structures and any fines or penalties levied against the project by regulatory agencies due to deficiencies of control measures.

B. Other than the land clearing activities required to install the appropriate erosion and sediment control measure in accordance with the erosion and sediment control plans, any down slope erosion and sediment control measures, on-site stream channel protection and upslope diversion of drainage required by site conditions, shall be in place and functional before any clearing or earth moving operations begin and shall be constructed and maintained throughout the construction period.

1. Temporary measures may be removed at the beginning of the workday but shall be replaced at the end of the workday.

C. The angle for graded slopes and fills shall be no greater than the angle which can be retained by vegetative cover or other adequate erosion control devices or structures. Any slope or fill which has been graded shall, within thirteen (13) days of the completion of such grading or the

completion of any phase of grading, be planted or otherwise be provided with ground cover, materials, devices, or structures sufficient to retain erosion. The devices, structures, and measures shall remain in place until the graded slope or fill is stabilized.

D. All hazardous substances used for this project shall be stored in accordance with current Spill Prevention Control and Countermeasures (SPCC) regulations.

1. Store substances away from storm drains, ditches, and gutters in water-tight containers.

2. Dispose of substances in accordance with ADEM regulations.

3. Provide adequate trash containers on-site for the disposal of material waste.

4. Prevent trash and debris from entering storm drainage system.

E. All construction materials shall be properly stored, not exposed to rain, and stockpiled. All containers shall be stored closed or under cover. All excess or waste material shall be disposed of properly.

1. Provide a construction waste dumpster or trailer on-site for disposal of construction waste.

2. Dispose of trash and waste to an acceptable offsite facility every week at a minimum.

3. Prevent trash and debris from entering storm drainage system.

F. There shall be no distinctly visible floating scum, oil, or other matter contained in the storm water discharge to a receiving water, must not cause an unnatural color (except dyes or other substances discharged for the purpose of environmental studies and which do not have a harmful effect on the receiving water) or odor in the receiving waters. The storm water discharge to receiving water must result in no material in concentration sufficient to be hazardous or otherwise detrimental to humans, livestock, wildlife, plant life, or fish and aquatic life in the receiving water.

1. Ensure all materials are handled appropriately.

2. No pollutants are allowed to be disposed of on-site or allowed to enter the storm drainage system.

G. Upon completion of the land disturbing activity and stable vegetation or other permanent controls have been established on all remaining exposed soil, the Contractor shall notify the Owner of this and request a final inspection.

1. The Owner, or his authorized agent, will inspect the site within 5 working days after receipt of notice.

H. The Contractor shall prevent the tracking of mud and debris onto paved roadways from construction areas.

1. Provide a construction exit pad in accordance with the erosion and sediment control plans and in accordance with the approved installation procedures, and maintain it on a daily basis.

    a. Provide a spray hose for the washing of tires and equipment

    b. Rework or supplement the construction exit pad stone as required to ensure its continued effectiveness throughout the duration of the construction period.

2. Remove any sediments tracked offsite or deposited on the adjacent roadways.

    a. Utilize a mechanically operated street sweeper to remove any mud and sediment deposited on the adjacent roadways.

I. The Contractor shall be responsible for keeping dust to a minimum through the use of water trucks or other dust controlling methods throughout the construction duration.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Quick growing grasses for temporary seeding (see seed mixes contained in CBMPP and in Plans).

B. Fencing for siltation control as specified on the plans.

C. Temporary mulches such as loose hay, straw, netting, wood cellulose or agricultural silage.

D. Fence stakes shall be metal stakes a minimum of 54 inches in length.

E. Stone check dams shall be spaced according to the Plans.

F. Stone Sediment Barriers or SiltSacks ™, or approved equal for inlet protection.

G. High Density Poly-Ethylene (HDPE) Filters or Silt-Saver™, or approved equal for inlet protection.

H. A stabilized construction entrance shall be constructed temporarily.

I. Riprap for slopes, culvert, storm drain inlet, and outlet aprons.

J. Water for dust control.

K. Wattle check dams shall be spaced according to plans.

L. Erosion control blankets and/or turf reinforcement mats to protect seed and prevent erosion on slopes.

PART 3 – EXECUTION

3.1 PREPARATION

A. Review site erosion and sediment control plan attached to this section of the specifications.

B. Deficiencies or changes in the erosion control plan as it is applied to current conditions will be brought to the attention of the Engineer for remedial action.

3.2 IMPLEMENTATION

A. Provide catalog cuts and information concerning the erosion control products which will be used for construction for review by the Engineer.

B. Provide information concerning the installation of the erosion and sedimentation control including anchorage trench provisions and anchorage devices and spacing for review by the Engineer.

C. Provide construction exit pad in accordance with the erosion and sediment control plan and in accordance with the approved installation procedures.

D. Place erosion control systems in accordance with the erosion and sediment control plan and in accordance with approved installation procedures.

E. The Engineer has the authority to limit the surface area of erodible earth material exposed by clearing and grubbing, excavation, borrow and embankment operations. The Owner has the authority to direct the Contractor to provide immediate permanent or temporary pollution control measures. The Contractor will be required to incorporate all permanent erosion control features into the project at the earliest practical time to minimize the need for temporary controls. Cut slopes shall be permanently seeded and mulched as the excavation proceeds to the extent considered desirable and practical.

F. The temporary erosion control systems installed by the Contractor shall be maintained as directed by the Engineer to control siltation at all times during the life of the Contract. The Contractor must respond to any maintenance or additional work ordered by the Engineer within a 48 hour period.

G. Slopes that erode easily shall be temporarily seeded as the work progresses according to the ALDOT seeding schedule or according to the seeding schedule contained in the plans.

H. Remove and properly dispose of accumulated silt and sediment from all erosion control measures on a daily basis off site unless material is reusable.

I. Remove and properly dispose of all trash and sediments accumulated in existing and new storm drainage inlets, structures, and pipes on a daily basis off site unless material is reusable.

J. Provide temporary diversion berms and ditches as required during construction to protect work areas from up-slope runoff and/or to divert sediment-laden water to appropriate sediment control devices, traps, or stabilized outlets.

K. Provide water trucks or other adequate method for controlling dust throughout the construction period.

END OF EROSION & SEDIMENTATION CONTROL

SECTION 31 3116
TERMITE CONTROL

PART 1 - GENERAL

1.01 SECTION INCLUDES

A. Soil-applied chemical treatment.

1.02 RELATED REQUIREMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Related work specified elsewhere includes:
   1. Section 03 3100 - Concrete.
   2. Section 31 2000 - Earth Moving.

1.03 DESCRIPTION OF WORK

A. Work described in this section includes soil treatment for termite control, for use and application below any new on-grade interior floor slabs, and also where any existing slabs may be opened or removed for any new, repair, replacement, or other subgrade work at interior of building and/or within interior perimeter exterior walls.

1.04 REFERENCE STANDARDS

A. Title 7, United States Code, 136 through 136y - Federal Insecticide, Fungicide and Rodenticide Act; 2019.

1.05 SUBMITTALS

A. See Section 01 3000 - Administrative Requirements, for submittal procedures.

B. Product Data: Indicate toxicants to be used, composition by percentage, dilution schedule, intended application rate.
   1. Include the EPA-Registered Label for termiticide products

C. Manufacturer's Instructions: Indicate caution requirement.

D. Qualification Data: For Installer of termite control products.

E. Soil Treatment Application Report: After application of termiticide is completed, submit report for Owner's record information, including the following:
   1. Date and time of application.
   2. Moisture content of soil before application.
   3. Brand name and manufacturer of termiticide.
   4. Quantity of undiluted termiticide used.
   5. Dilutions, methods, volumes, and rates of application used.
   6. Areas of application.
   7. Water source for application.

F. Submit completed forms for required warranties, guarantees, and bonds for acceptance, prior to beginning work.

G. Executed warranty.

1.06 QUALITY ASSURANCE

A. Installer Qualifications: Company specializing in performing work of type specified, with minimum 3 years of documented experience.

B. In addition to requirements of these specifications, comply with manufacturer's instructions and recommendations for work, including preparation of substrate and application.

C. Source Limitations: Obtain termite control products through one source and from a single manufacturer for each product.

D. Use only termiticides which bear a Federal registration number of the U.S. Environmental Protection Agency.
   1. Formulate and apply termiticides according to the EPA-Registered Label.

E. Mix treatment solution on site, in presence of Contractor's Superintendent, using clean potable water and new termiticide delivered to site in undamaged, original, unopened, and factory-sealed containers.

1.07 REGULATORY REQUIREMENTS

A. Conform to applicable code for requirements for application, application licensing, and authority to use toxicant chemicals, and comply with EPA regulations.

B. Provide certificate of compliance from authority having jurisdiction indicating approval of toxicants where required.

1.08 SEQUENCING

A. Apply toxicant immediately prior to installation of vapor barrier under slabs-on-grade.

1.09 JOB CONDITIONS

A. Restrictions: Do not apply soil treatment solution until excavating, filling and grading operations are completed, except as otherwise required in construction operations.

B. Environmental Limitations: To insure penetration, do not treat soil that is water saturated or frozen. Do not treat soil while precipitation is occurring. Comply with requirements of the EPA-Registered Label and requirements of authorities having jurisdiction.

1.10 WARRANTY

A. See Section 01 7800 - Closeout Submittals for additional warranty requirements.

B. Provide five year installer's warranty against damage to building caused by termites.
   1. Provide paid-up and bonded guarantee for a period of five (5) years from date of treatment, signed by the Applicator and Contractor. Paid-up guarantee shall include annual inspection during the five (5) years and an agreement to renew the bond annually after the five (5) years is up, on payment by the Owner of an annual fee.
   2. Inspect annually and report in writing to Owner. Provide inspection service for 5 years from Date of Substantial Completion.
   3. A specimen of the form of guarantee and the bond shall be submitted for approval before the work begins.

C. Soil Treatment Special Warranty: Manufacturer's standard form, signed by Applicator and Contractor, certifying that termite control work consisting of applied soil termiticide treatment will prevent infestation of subterranean termites, including Formosan termites (Coptotermes formosanus). If subterranean termite activity or damage is discovered during warranty period, re-treat soil and repair or replace damage caused by termite infestation.
   1. Warranty Period: Five years from date of Substantial Completion.

D. Wood Treatment Special Warranty: Manufacturer's standard form, signed by Applicator and Contractor, certifying that termite control work consisting of applied wood termiticide treatment will prevent infestation of subterranean termites, including Formosan termites (Coptotermes formosanus). If subterranean termite damage is discovered during warranty period, repair or replace damage caused by termite infestation and treat replacement wood.
   1. Warranty Period: 12 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 CHEMICAL SOIL TREATMENT

A. Toxicant Chemical: EPA Title 7, United States Code, 136 through 136y approved; synthetically color dyed to permit visual identification of treated soil.

B. Manufacturers/Products: Subject to compliance with requirements, provide one of the following termiticide products:
   1. Aventis Environmental Science USA LP; Product "Termidor".

2. Bayer Environmental Science Corp; Product "Premise 75, Premise Pre-Construction, or Premise Pro": www.nobugs.com.
3. Nisus; Product "Bora-Care": www.nisuscorp.com.
4. Syngenta Professional Products: www.syngentaprofessionalproducts.com.

C. Termiticide: Provide an EPA-registered termiticide complying with requirements of authorities having jurisdiction, in an aqueous solution formulated to prevent termite infestation. Provide quantity required for application at the label volume and rate for the maximum termiticide concentration allowed for each specific use, according to product's EPA-Registered Label.

D. Diluent: Recommended by toxicant manufacturer.
1. Fuel oil will not be permitted as a dilutent.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that soil surfaces are unfrozen and dry to absorb toxicant, ready to receive treatment.

B. Verify final grading is complete; see Section 31 2200.

C. Verify utility trenches are wide enough to receive application.

D. Examine substrates, areas, and conditions, with Applicator present, for compliance with requirements for moisture content of soil, interfaces with earthwork, slab and foundation work, landscaping, and other conditions affecting performance of termite control.
1. Proceed with application only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

A. General: Comply with the most stringent requirements of authorities having jurisdiction and with manufacturer's written instructions for preparation before beginning application of termite control treatment. Remove all extraneous sources of wood cellulose and other edible materials such as wood debris, tree stumps and roots, stakes, formwork, and construction waste wood from soil within and around foundations.

B. Soil Treatment Preparation: Remove foreign matter and impermeable soil materials that could decrease treatment effectiveness on areas to be treated. Loosen, rake, and level soil to be treated except previously compacted areas under slabs and footings. Termiticides may be applied before placing compacted fill under slabs if recommended in writing by termiticide manufacturer.
1. Fit filling hose connected to water source at the site with a backflow preventer, complying with requirements of authorities having jurisdiction.

3.03 APPLICATION - CHEMICAL TREATMENT

A. Comply with requirements of U.S. EPA and applicable state and local codes.
1. Comply with the most stringent requirements of authorities having jurisdiction and with manufacturer's EPA-Registered Label for products.

B. Mix soil treatment termiticide solution to a uniform consistency. Provide quantity required for application at the label volume and rate for the maximum specified concentration of termiticide, according to manufacturer's EPA-Registered Label, to the following so that a continuous horizontal and vertical termiticidal barrier or treated zone is established around and under building construction. Distribute treatment evenly.

C. Spray apply toxicant in accordance with manufacturer's instructions.

D. Apply toxicant at following locations:
1. Under Slabs-on-Grade and Basement Slabs: Under ground-supported slab construction, including footings, building slabs, and attached slabs as an overall treatment.
a. Under slab-on-grade structures, treat soil before concrete footings and slabs are placed, using the following rates of application (unless manufacturer recommends otherwise):

1) Apply four (4) gallons of chemical solution per ten (10) linear feet to soil in critical areas under slab, including entire inside perimeter inside of foundation walls, along both sides of interior partition walls, around plumbing pipes and electric conduit penetrating slab, and around interior column footers.
2) Apply one (1) gallon of chemical solution per ten (10) square feet as an overall treatment under slab and attached slab areas where fill is soil or unwashed gravel. Apply 1-1/2 gallons of chemical solution to areas where fill is washed gravel or other coarse absorbent material.
3) Apply four (4) gallons of chemical solution per ten (10) linear feet of trench, for each foot of depth from grade to footing, along outside edge of building. Dig a trench six (6) inches to eight (8) inches wide along outside of foundation to a depth of not less than twelve (12) inches. Punch holes to top of footing on not more than twelve (12) inches on center and apply chemical solution. Mix chemical solution with the soil as it is being replaced in trench

2. In Crawl Spaces: Soil under and adjacent to foundations as previously indicated. Treat adjacent areas including around entrance platform, porches, and equipment bases. Apply overall treatment only where attached concrete platform and porches are on fill or ground.
   a. In crawl-space and basement structures, treat soil along exterior and interior walls of foundations with shallow footings as specified above for exterior of slab-on-grade structures. Treat soil under or around crawl-space structures using the following rates of application (unless manufacturer recommends otherwise):
      1) Apply four (4) gallons of chemical solution per ten (10) linear feet of trench along inside of foundation walls, along both sides of interior partitions, and around piers and plumbing. Do not apply an overall treatment in crawl spaces.
      2) Apply four (4) gallons of chemical solution per ten (10) linear feet of trench, for each foot of depth from grade to footing, along outside of foundation walls.
      3) Apply one (1) gallon per ten (10) square feet of soil surface as an overall treatment, where attached concrete structures are on fill or ground.
3. Foundations: At Both Sides of Foundation Surface: Adjacent soil including soil along the entire inside perimeter of foundation walls, along both sides of interior partition walls, around plumbing pipes and electric conduit penetrating the slab, and around interior column footers, piers, and chimney bases; also along the entire outside perimeter, from grade to bottom of footing. Avoid soil washout around footings.
4. At hollow masonry foundations or grade beams:
   a. Treat voids at rate of two (2) gallons per ten (10) linear feet (unless manufacturer recommends otherwise), poured directly into the hollow spaces.
5. Masonry: Treat voids.
6. At expansion joints, control joints, and areas where slabs will be penetrated:
   a. Apply at rate of four (4) gallons per ten (10) linear feet of penetration (unless manufacturer recommends otherwise).
7. Soil Within 10 feet (3 m) of Building Perimeter For a Depth of 1 foot .

E. Under slabs, apply toxicant immediately prior to installation of vapor barrier.

F. At foundation walls, apply toxicant immediately prior to finish grading work outside foundations.

G. Apply extra treatment to structure penetration surfaces such as pipe or ducts, and soil penetrations such as grounding rods or posts.

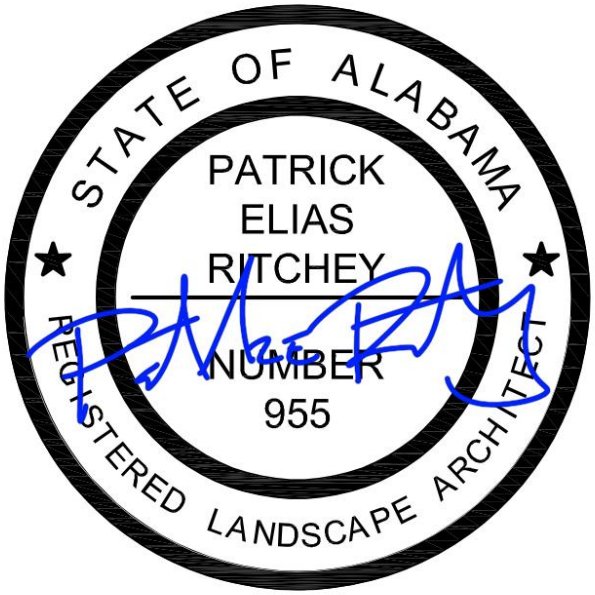
H. Avoid disturbance of treated soil after application. Keep off treated areas until completely dry.

I. Protect termiticide solution, dispersed in treated soils and fills, from being diluted until ground-supported slabs are installed. Use waterproof barrier according to EPA-Registered Label instructions.

J. Re-treat disturbed treated soil with same toxicant as original treatment.
   1. Reapply soil treatment solution to areas disturbed by subsequent excavation, grading, landscaping, or other construction activities following application.

K. If inspection or testing identifies the presence of termites, re-treat soil and re-test.

L. Post signs in areas of application warning workers that soil termiticide treatment has been applied. Remove signs when areas are covered by other construction.



3.04 PROTECTION

A. Do not permit soil grading over treated work.

B. Protect applications from damage after completion. Repair disturbances according to manufacturer's written instructions.

SECTION 32 1216

ASPHALT PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specifications Sections, apply to this Section.

B. Related work described elsewhere includes:

.. Section 31 2000 - "Earth Moving"
.. Section 32 1313 - "Concrete Paving"
.. Section 32 1613 - "Curbs and Gutters"

1.2 DESCRIPTION OF WORK

A. Work described in this section includes new bituminous paving, a new base, and otherwise as indicated on drawings.

B. Work shall also include pavement patching for any utility trenches under existing paving and this Contract, with prepared subgrade, 8" crushed aggregate base, 6 inch thick 3,000 psi concrete, prime coat, and 1-1/2 inches bituminous concrete overlay, and as indicated on the Drawings.

1. Pavement patch shall extend 9" to 1'-0" beyond each side or edge of trench, and to abut flush with edge where existing paving was cut out.

1.3 QUALITY CONTROL

A. Certifications: The Contractor shall submit to the Architect copies of certificates from suppliers of bituminous materials and other manufactured items, certifying that these products comply with specifications and standards listed hereinafter.

1. All asphalt used for pavement shall be produced by a plant certified by the Alabama Department of Transportation (ALDOT).

B. Standard Specifications: Unless otherwise noted, all specifications referred to shall be the "Alabama Department of Transportation (ALDOT) Standard Specifications for Highway Construction", latest edition.

C. Testing: All laboratory and field testing required to ensure compliance with these specifications will be performed by an independent testing laboratory. Refer to Section 01 0150 - "Special Conditions," for additional information.

1.4 JOB CONDITIONS

A. Any base or sub-base areas damaged by weather or construction operations shall be scarified, remixed and recompacted in accordance with requirements before application of the prime coat.

B. Special care and attention shall be given to be certain that paving operations and/or equipment do not cause damage to any existing and/or new buildings, structures, or improvements which are to remain.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Provide the paving system(s) indicated on the Drawings, installed in accordance with Part 3 of this Section, and referenced standards.

PART 3 - EXECUTION

3.1 PRIME COAT

A. Application rates and construction requirements shall be as specified in ALDOT Section 401, Bituminous Surface Treatments, for a Bituminous Treatment Type "A" which is a prime coat.

3.2 TACK COAT

A. Construction requirements, including preparation of the existing surface or substrate and maximum application rates, are specified in ALDOT Article 405.03.

3.3 PLANT MIX BITUMINOUS CONCRETE BINDER LAYER AND BITUMINOUS CONCRETE WEARING SURFACE

A. Construction requirements, including finished surface tolerance, density requirements, and maintenance and protection shall be as specified in ALDOT Articles 410.03 through 410.07, 327.03 and 424.04, as applicable. Rate of application shall be not less than the number of pounds per square yard for a 1-inch wearing surface or pavement patching layer, pro-rated for other thicknesses, as required by referenced ALDOT Specifications.

3.4 CRUSHED AGGREGATE BASE

A. Construction requirements shall comply with the ALDOT Specifications for the materials indicated, including in part, applicable portions of Section 825, Type B and ALDOT Section 301; compacted in accordance with the recommendations made in the geotechnical investigation.

3.5 COMPACTION EQUIPMENT

A. Compaction equipment shall be self-propelled, capable of compacting the mixture throughout the depth of the layer while it is still in a workable condition without damage to the material.

1. Self-propelled rollers shall have a minimum weight of 10 tons.

3.6 PAVEMENT PATCH

A. Saw cut perimeter of existing paving to a neat straight line where removal is indicated and/or required.

1. Protect edges of paving and base exposed to prevent cracking, breaking-up, wash-out, erosion, and/or other damage; apply prime coat as specified and at all such vertical edges prior to placing new pavement.

B. Patch pavement with components stated in Paragraph 1.2-B above, in compliance with each component's specified requirements, and as per details and sections on Drawings, if any.

END OF ASPHALT PAVING

SECTION 32 1313

CONCRETE PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS:

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Related work specified elsewhere includes:

.. Section 31 2000 - "Earth Moving"
.. Section 03 3100 - "Concrete"
.. Section 07 9000 - "Joint Sealers"

1.2 DESCRIPTION OF WORK:

A. Extent of portland cement concrete paving is shown on drawings, including exterior walks, paving, entry pads, dumpster pads, and mechanical equipment pads.

1.3 QUALITY ASSURANCE:

A. Codes and Standards: Comply with "Alabama Department of Transportation (ALDOT) Standard Specifications for Highway Construction," latest edition, and local governing regulations if more stringent than herein specified.

B. Testing: All laboratory and field testing required to ensure compliance with these specifications will be performed by a qualified independent testing laboratory. Refer to Section 01 0150 - "Special Conditions", for additional information and requirements.

PART 2 - PRODUCTS

2.1 MATERIALS:

A. Forms:

1. Steel, wood, or other suitable material of size and strength to resist movement during concrete placement and to retain horizontal and vertical alignment until removal. Use straight forms, free of distortion and defects.

2. Use flexible spring steel forms or laminated boards to form radius bends as required.

3. Coat forms with a non-staining form release agent that will not discolor or deface surface of concrete.

B. Welded Wire Mesh:

1. Welded plain cold-drawn steel wire fabric, ASTM A 185.

a. Size: 6” x 6” #6, unless indicated otherwise.

2. Furnish in flat sheets, not rolls, unless otherwise acceptable to Engineer, for all concrete paving subject to possibility of bearing the weight of vehicular traffic.

3. Furnish in rolls for all concrete paving accessible only to pedestrian traffic, unless indicated otherwise on structural drawings.

4. Locations for Use: All concrete pads and paving, at 1/3 of total depth of concrete from top of slab.

C. Reinforcing Bars: Deformed steel bars, ASTM A 615, Grade 40 or 60.

D. Concrete Materials: Comply with requirements of Section 03 3100 - “Concrete”, for concrete materials, admixtures, bonding materials, and other materials as required.

E. Expansion Joint Materials: Comply with requirements of Section 07 9000 - “Joint Sealers” for preformed and pourable expansion joint fillers and sealers.

F. Curing and Sealing Compound: Conform to TT-C-800, with 30% solids content minimum.

2.2 CONCRETE MIX, DESIGN AND TESTING:

A. Comply with requirements of Section 03 3100 - “Concrete”, for concrete mix design, sampling and testing, and quality control, and as herein specified.

B. Design mix to produce normal-weight concrete consisting of portland cement, aggregate, water-reducing or high-range water-reducing admixture (super-plasticizer), air-entraining admixture and water to produce the following properties:

1. Sidewalks, curbs and gutters, entry pads, and mechanical equipment pads subject only to pedestrian traffic:

a. Compressive Strength: 3,000 psi, minimum at 28 days.
b. Maximum Slump: 3"
c. Air Content: 2.5% to 6%
d. Thickness: 6", unless indicated otherwise.
e. Compacted Subgrade: 6" crushed aggregate base on compacted subgrade (98% S.P.D.).

2. Paving and pads subject to vehicular traffic, valley gutters, dumpster pads, and where indicated:

a. Compressive Strength: 4,000 psi, minimum at 28 days (minimum 550 psi flexural strength) in accordance with ALDOT Section 450 – "Portland Cement Concrete

Pavement", of the Alabama Department of Transportation, Standard Specifications for Highway Construction, most current edition.

b. Maximum Slump: 3.5”
c. Air Content: 2.5% to 6%
d. Thickness: 6", unless greater thickness is indicated on the Drawings.
e. Subgrade: Unless otherwise indicated on the Drawings, 6" dense graded aggregate base, ALDOT Section 825, Type B (98% M.P.D.), installed in accordance with construction requirements for the materials indicated, including in part, applicable portions of Section 825 and Section 301.

PART 3 - EXECUTION

3.1 SURFACE PREPARATION:

A. Remove loose material from compacted subbase surface immediately before placing concrete.

B. Proof-roll prepared subbase surface to check for unstable areas and need for additional compaction. Do not begin paving work until such conditions have been corrected and are ready to receive paving.

C. Subgrade shall be approved by the Owner's Geotechnical Engineer before paving begins.

3.2 FORM CONSTRUCTION:

A. Set forms to required grades and lines, rigidly braced and secured. Install sufficient quantity of forms to allow continuous progress of work and so that forms can remain in place at least 24 hours after concrete placement.

B. Check completed formwork for grade and alignment to following tolerances:

1. Top of forms not more than 1/8" in 10'.

2. Vertical face on longitudinal axis, not more than 1/4" in 10'.

C. Clean forms after each use, and coat with form release agent as often as required to ensure separation from concrete without damage.

3.3 REINFORCEMENT:

A. Locate, place and support reinforcement as specified in Section 03 3100 – “Concrete”, unless otherwise indicated. Install welded wire fabric in as long lengths as practicable, lapping at least on mesh.

3.4 CONCRETE PLACEMENT:

A. Comply with requirements of Section 03 3100 - “Concrete”, for mixing and placing concrete, and as herein specified.

B. Do not place concrete until subbase and forms have been checked for line and grade. Moisten subbase, if required, to provide a uniform dampened condition at time concrete is placed. Do not

place concrete around manholes or other structures until they are at required finish elevation and alignment.

C. Place concrete using methods which prevent segregation of mix. Consolidate concrete along face of forms and adjacent to transverse joints with internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Use only square-faced shovels for hand-spreading and consolidation. Consolidate with core to prevent dislocation of reinforcing, dowels, and joint devices.

1. Deposit and spread concrete in a continuous operation between transverse joints, as far as possible. If interrupted for more than 1/2-hour, place a construction joint.

3.5 JOINTS:

A. General: Construct expansion, weakened-plane (contraction), and construction joints true-to-line with face perpendicular to surface of concrete. Construct transverse joints at right angles to the centerline, unless otherwise indicated.

B. Weakened-Plane (Contraction) Joints:

1. Provide weakened-plane (contraction) joints, sectioning concrete into areas as shown on drawings. Construct weakened-plane joints for a depth equal to at least 1/4 concrete thickness, as follows below.

2. Tooled Joints: Form weakened-plane joints in fresh concrete by grooving top portion with a recommended cutting tool and finishing edges with a jointer.

3. Sidewalks shall be scored at 5-foot intervals unless otherwise indicated.

C. Construction Joints: Place construction joints at end of placements and at locations where placement operations are stopped for a period of more than 1/2-hour, except where such placements terminate at expansion joints.

D. Expansion Joints:

1. Provide expansion joints with premolded joint filler at locations abutting concrete curbs, catch basins, manholes, inlets, structures, walks and other fixed objects, unless otherwise indicated.

2. Extend joint fillers full-width and depth of joint.

3. Furnish joint fillers in one-piece lengths for full width being placed, wherever possible. Where more than one length is required, lace or clip joint filler sections together.

4. Expansion joints for sidewalks shall be placed at 30-foot maximum intervals and along all intersections with other walks, steps, curbs, or other vertical surfaces.

E. Fillers and Sealants: Comply with the requirements of Section 07 9000 - “Joint Sealers”, for preparation of joints, materials, installation and performance.

3.6 CONCRETE FINISHING:

A. After striking-off and consolidating concrete, smooth surface by screeding and floating. Using hand methods only where mechanical floating is not possible. Adjust floating to compact surface and produce uniform texture.

B. After floating, test surface for trueness with a 10' straightedge. Distribute concrete as required to remove surface irregularities, and refloat repaired areas to provide a continuous smooth finish.

C. Work edges of slabs and formed joints with an edging tool, and round to 1/4" radius, unless otherwise indicated. Eliminate tool marks on concrete surface.

D. After completion of floating and troweling, when excess moisture or surface sheen has disappeared, complete surface finishing, as follows:

1. Light and smooth broom finish, by drawing a fine-hair broom across concrete surface, perpendicular to line of traffic. Repeat operation as required to provide a fine line texture acceptable to Architect.

E. On inclined slab surfaces, provide a coarse, non-slip finish by scoring surface with a stiff-bristled broom, perpendicular to line of traffic.

F. Do not remove forms for 24 hours after concrete has been placed. After form removal, clean ends of joints and point-up any minor honeycombed areas. Remove and replace areas or sections with major defects, as directed by Architect.

1. Provide rubbed finish for exposed edges of concrete work, and apply light and smooth broom finish.

3.7 CURING:

A. Protect and cure finished concrete paving, complying with applicable requirements of Section 03 3100 - “Concrete”. Use curing and sealing compound or approved moist-curing methods.

B. Begin initial curing as soon as free water has disappeared from exposed surfaces. Where possible, keep continuously moist for not less than 72 hours. Continue curing by use of moisture-retaining cover or membrane-forming curing compound. Cure formed surfaces by moist curing until forms are removed. Provide protections as required to prevent damage to exposed concrete surfaces.

3.8 REPAIRS AND PROTECTIONS:

A. Repair or replace broken or defective concrete, as directed by Architect.

B. Drill test cores where directed by Architect, when necessary to determine magnitude of cracks or defective areas. Fill drilled core holes in satisfactory pavement areas with portland cement concrete bonded to pavement with epoxy resign grout.

C. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials as they occur.

1. Sweep concrete pavement and wash free of stains, discolorations, dirt and other foreign material just prior to final inspection.

END OF CONCRETE PAVING

SECTION 32 1613

CURBS AND GUTTERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division I Specification Sections, apply to this section.

B. Related work specified elsewhere includes:

.. Section 31 2000 - "Earth Moving"
.. Section 32 1313 - "Concrete Paving"
.. Section 03 3100 - "Concrete"
.. Section 07 9000 - "Joint Sealers"

1.2 DESCRIPTION OF WORK

A. Work described in this section includes the construction of new concrete curbs and gutters, and/or straight curbs where indicated, and patching between any existing paving and new curb and gutters, sidewalks, etc., to match existing pavement.

B. Refer to Drawings and Owner's Report of Geotechnical Exploration, for additional information and base requirements.

C. Refer to Section 31 2000 - "Earth Moving" for subgrade requirements below and beyond curbs and gutters.

D. Refer to Section 32 1313 - "Concrete Paving", for valley gutters, turn-outs, and paving.

1.3 QUALITY CONTROL

A. Certifications: The Contractor shall submit to the Architect copies of certificates from suppliers of ready-mix concrete, reinforcing steel, curing material, joint fillers, and other manufactured items, certifying that these products comply with the specifications and standards listed hereinafter.

B. Standard Specifications: Unless otherwise noted, all specifications referred to shall be the Alabama Department of Transportation (ALDOT) Standard Specifications for Highway Construction, latest edition.

C. Testing: All laboratory and field testing as required to ensure compliance with these specifications shall be performed by a qualified independent testing laboratory. Refer to Section 01 0150 - "Special Conditions", for additional information.

PART 2 – PRODUCTS

2.1 MATERIALS

A. Concrete shall be Class "A", Type 4 (3,000 psi), in accordance with Section 501, "Structural Portland Cement Concrete", of the Alabama Department of Transportation (ALDOT) Standard Specifications for Highway Construction, latest edition. A modified mix shall be used if optional machine laid curb and gutter is constructed.

B. Reinforcing steel, where called for on the drawings, shall meet the requirements of Section 502, "Steel Reinforcement".

C. Curing material shall be either burlap cloth, waterproof paper, polyethylene sheeting, or impervious membrane specified in ALDOT Articles 830.01 and 830.02.

D. Joint filler and sealer for expansion and construction joints shall meet the appropriate requirements of ALDOT Section 832, and Section 07900 - "Joint Sealers" herein.

E. Asphalt for repairs shall comply with referenced ALDOT Specifications, and city requirements, and shall match existing pavement at location(s) requiring patching.

PART 3 - EXECUTION

3.1 CURBS AND GUTTERS

A. Comply with requirements of Section 32 1313 - "Concrete Paving," Section 03 3100 - "Concrete," and the following:

1. Construction requirements, including foundation, forms, sections, joints, placing and finishing concrete, curing and protection, and backfilling shall be as specified in Article 623.03. Curbs and gutters shall match the profile of existing adjoining curb and gutter, if any, and otherwise as detailed.

2. Curb and gutter shall be constructed in sections having a maximum length of 10-feet. Transverse expansion joints with filler and joint sealer shall be installed at all curb returns and in curb and gutter at intervals not exceeding 40-feet. Similar joints shall be installed behind the curb where sidewalks adjoin the curb and gutter, and at all fixed objects which adjoin or extend through the curb and gutter.

3. Care shall be exercised that "tilt-out" curb and gutter is installed where pavement slopes away from the curb, and that 10-foot long transition sections are used where required to transition between "standard" and "tilt-out" curb and gutter.

3.2 REPAIRS AND PROTECTIONS

A. Repair or replace broken or defective concrete, as directed by Architect.

B. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 14-days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials as they occur.

1. Sweep concrete pavement and wash free of stains, discolorations, dirt and other foreign material just prior to final inspection.

END OF CONCRETE CURBS AND GUTTERS

SECTION 32 1723

PAVEMENT MARKING

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

A. Work described in this section includes marking of graphic symbols, lane separations, parking stripes, and lettering on concrete and asphalt pavements, if any, at locations indicated and as shown on the Drawings.
B. Related work specified elsewhere includes:
.. Section 32 1216 - "Asphalt Paving"
.. Section 32 1313 - "Concrete Paving"

1.2 QUALITY CONTROL

A. Certifications: The Contractor shall submit to the Architect copies of certificates from suppliers of materials, certifying that these products comply with specifications and standards listed hereinafter.
B. Standard Specifications: Unless otherwise noted, all specifications referred to shall be Alabama Department of Transportation (ALDOT) Standard Specifications for Highway Construction, most current edition.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Paint for pavement marking shall be, traffic marking paint complying with Section 856, of the ALDOT specifications, and as follows:

1. Class 1, Type A (reflective) in public Right-of-Ways.
2. Class 1, Type B (non-reflective) within property lines of this project's site, 2 coats.

PART 3 - EXECUTION

3.1 PAVEMENT MARKING:

A. Each individual painted parking stripe shall be 4-inches wide, and shall be laid out as indicated on the drawings. Construction requirements shall conform to the applicable parts of Article 701.03 of the ALDOT Specifications for Class 1, Type as specified, traffic stripe.

1. Color shall be white for asphalt, yellow for concrete pavement, and international blue for striping and graphics for parking spaces for people with disabilities.
2. Use same materials and construction methods for any arrows and symbols indicated on paved areas.
3. Mark paving at each space for the people with disabilities with acceptable international graphics symbol, unless otherwise indicated, approximately 4' x 4' in

size. Locate centered in space width and approximately 2'-0" from end of space where vehicle enters.

END OF PAVEMENT MARKING

SECTION 32 3300
SITE FURNISHINGS

PART 1- GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and General provisions of the Contract, including General and Supplementary Conditions and Division 1 Specifications Sections apply to the work of this Section.

B. Sections 02751 – "Portland Cement Concrete Paving".

C. Section 03310 – "Concrete".

1.02 DESCRIPTION OF WORK:

A. This Section includes the following:
   a. Trash Receptacles.
   b. Picnic Tables
   c. Wood Bench

B. The extent of site is indicated of the drawings.

1.03 SUBMITTALS:

A. Submit the following:

1. Manufacturer's specifications and product data for each type of site and street furnishing.

2. Shop Drawings and Installation Drawings: Submit for each type of site furnishing.

3. Where color and finish variations are available, submit finished physical samples of materials for review and selection.

4. Warranty: Submit warranty for fixture made out in Owner's name.

1.04 Warranty:

A. Provide manufacturer's advertised warranty on furnishings.

PART 2- PRODUCTS

2.01 GENERAL:

A. Furnish and install site furnishings in the quantities indicated.

2.02 TRASH RECEPTACLE:

A. Litter Receptacle, 30 gallon capacity, with polyethylene liner.

B. Receptacle formed of 11-gauge steel.

C. Finish: Powdercoat, in color selected by Architect from manufacturer's full range of colors.

D. Product/Manufacturer:
   a. Petoskey, with hinged lid style, as manufactured by LandscapeForms: www.landscapeforms.com
   b. For substitutions: See Section 01600 – Product Requirments.

2.03 PICNIC TABLE WITH BENCHES:

A. Picnic table with benches attached, 6 feet long. Bolted to concrete patio slab.

B. Product/Manufacturer:
   a. Larchmont Picnic Table #4859 Picnic Table, 6' long: www.countrycasual.com
   b. For substitutions: See Section 01600 - Product Requirements.

2.04 WOOD BENCH:

A. Surface mounted wood bench, 6 feet long. Bolted/attached to concrete patio slab.

B. Product/Manufacturer:
   a. Wellspring Collection, 72 inch bench, 17.5" seat height, 25"D x 34"H x 72"L, as manufactured by LandscapeForms: www.landscapeforms.com.
   c. For substitutions: See Section 01600 - Product Requirements.

PART 3-EXECUTION

3.01 SYSTEM DESIGN:

A. Install at locations indicated and only with prior confirmation by the Architect, in strict accordance with manufacturer's current written instructions and recommendations.

B. Provide and install all necessary anchors and fasteners. Where requested, paint bolt heads to match surrounding finish or in another color, as selected by Architect.

B. Coordinate installation and fitting with the work of other trades.

3.02 INSTALLATION:

A. Install in accordance with manufacturer's recommendations.

3.03 CLEANING AND PROTECTION:

A. Clean furnishings of all foreign matter and touch-up marred finishes in accordance with manufacturer's current written recommendations.

B. Clean Repair any items damaged prior to Substantial Completion and/or as a result of the work of this Contract, subject to Architect's and Owner's acceptance, or replace.

END OF SECTION 32 3300

SECTION 32 8420
UNDERGROUND IRRIGATION
(PERFORMANCE SPECIFICATION)

PART 1- GENERAL

1.01 SUMMARY:

A. Work Included: Provide an underground sprinkler system based on these specifications and as required for complete coverage of designated landscaped areas. Work includes, but is not limited to:
   1. Landscape sprinkler system.
   2. Automatic controller, remote valves and wiring.
   3. Responsibility for full and complete coverage of all designated irrigated areas denoted on plan sheet L7.00, including necessary adjustments during installation, maintenance and guarantee periods at no additional cost.
   4. Specified maintenance and guarantee period.

1.02 RELATED WORK:

A. Landscape Work- Section 32 9000.

1.03 QUALITY ASSURANCE:

A. Codes and Standards: In addition to complying with all pertinent codes and regulations, comply with the latest rules of the National Electric Code for all electrical work and materials.

B. Manufacturer Qualifications: Provide underground sprinkler system as complete unit produced by a single acceptable manufacturer, including heads, valves, piping circuits, controls, and accessories.

1.04 SUBMITTALS:

A. Submit the following:
   1. Project Record Drawings: Provide separate and complete Project Record Drawings prepared in accordance with the provisions of Division 1 Series of these Specifications.

1.05 JOB CONDITIONS:

A. Utilities: Determine location of underground utilities and perform work in a manner which will avoid all possible damage. Hand excavate, as required. Repair damage to utility owner's satisfaction at no additional cost.

PART 2- PRODUCTS

2.01 MATERIALS:

A. Manufacturer: Subject to compliance with requirements, provide products of one of the following:

1. Rain Bird Sprinkler Mfg. Corp.
2. Hunter Industries Incorporated.

B. Pipe: PVC plastic pipe, ASTM D-1785, Schedule 40, for sleeves, mainline, and pipe under paving; PVC plastic pipe D-2241, SDR/PR 200 elsewhere.

C. Pipe Fittings: For PVC plastic pipe, ASTM D-2466 socket fittings with ASTM D-2564 solvent cement.

D. Valves: Manufacturer's standard, of type and size indicated, and as follows. Provide cast bronze bodies, unless otherwise indicated.
1. Manual Station Valves: Globe valves.
2. Key Operated Valves: Manual valves, fitted for key operation. Furnish 3 valve keys.
3. Automatic Circuit Valves: Globe valves operated by low-power solenoid, normally open manual flow adjustment.
4. Automatic Drain Valves: Designed to open for drainage when line pressure drops below 3 psi.

E. Backflow Preventer: Watts No. 709 Series Backflow Preventer or approved equal.

F. Water Meter: Provide separate water meter, if required, for irrigation system sized as per manufacturer's recommendation.

G. Sprinkler Heads: Manufacturer's standard unit designed to provide uniform coverage over entire area of spray at available water pressure, as follows:
1. Flush Surface: Fixed pattern, with screw-type flow adjustment.
2. Pop-Up Spray: Fixed pattern, with screw-type flow adjustment and stainless steel retraction spring.
3. Shrubbery: Fixed pattern, with screw-type flow adjustment.
4. Pop-Up Rotary Spray: Gear drive, full circle and adjustable part circle type.

H. Valve Box: Precast by Ametek, or approved equal.

I. Valve Cover and Frame: By Ametek, with provision for locking.

2.02 AUTOMATIC CONTROL SYSTEM:

A. General: Provide low voltage system manufactured expressly for control of automatic circuit valves of underground sprinkler systems. Provide unit of capacity to suit number of stations as indicated.

B. Exterior Control Enclosure: Manufacturer's standard weatherproof enclosure with locking cover, complying with NFPA 70 (National Electric Code).

C. Transformer: To convert building service voltage to control voltage of 24 volts.

D. Station Control: Each station variable from approximately 5 to 60 minute. Include switch for manual or automatic operation of each circuit.

E. Timing Device: Adjustable, 24-hour and 7 or 14 day clocks to operate any time of day and skip any day in a 7 or 14 day period. Allow for manual or semi-automatic operation without disturbing preset automatic operation.

PART 3-EXECUTION

3.01 SYSTEM DESIGN:

A. Design Pressures: Follow manufacturer's performance recommendations for specific head type and intended coverage.

B. Location of Heads: Lay out heads to achieve complete and uninterrupted coverage and minimize water wasted by overthrow on pavement.

3.02 TRENCHING AND BACKFILLING:

A. General: Excavate straight and true with bottom uniformly sloped to low points. Protect existing or previously installed lawns and plantings. Remove and replant as necessary to complete installation. Replace damaged plants with new to match existing.

B. Trench Depth: Excavate trenches to a depth of 3" below invert of pipe, unless otherwise indicated.

C. Minimum Cover: Provide 12" minimum cover over top of installed main line piping, 12" minimum cover over lateral lines, or meet local requirements for minimum cover, whichever is greater.

D. Backfill: Backfill with clean material from excavation. Remove organic material as well as rocks and debris larger than 1" diameter. Place acceptable backfill material in 6" layers, compacting each layer.

E. Pavements: Where existing pavements must be cut to install landscape irrigation system, cut smoothly to straight lines 6" wider than trench. Wherever possible, bore under paved areas. Excavate trench to required depth and width. Trench depth shall be a minimum equal to depth of pavement and base, and of sufficient depth to meet minimum coverage requirements. Remove cut-out pavement and excavated material from the site. Replace pavement cuts with equal materials and finishes.

F. Sleeving: Provide schedule 40 PVC Sleeving for all piping under new paving.

3.03 INSTALLATION:

A. General: Comply with requirements of the Standard Plumbing Code and all local codes and ordinances.

B. Connection to Main: Determine main line location. Connect to existing main line in such a manner as to reduce wasted pipe. Install new valve and union.

C. Maintain uninterrupted water service to building during normal working hours. Coordinate temporary water shut-off with Owner.

D. Backflow Preventer: Provide union on downstream side of main line. Assembly shall be housed in an above ground, waterproof housing. This housing shall be accessible for periodic testing purposes. Irrigation Contractor is to consult local codes and authorities to assure proper installation of the assembly.

E. Station Valves: Install in valve box, arrange for easy adjustment and removal. Provide union on downstream side. Adjust automatic control valves to provide flow rate of rated operating pressure required for sprinkler circuit.

F. Piping:
1. Lay pipe on solid subbase, uniformly sloped without humps or depressions.
2. At wall penetrations, fill the opening around pipe with non-shrink grout. At exterior face, leave a perimeter slot approximately 1/2" wide by 3/4" deep. Fill this slot with backer rod and an acceptable elastomeric sealant. Repair below grade waterproofing disturbed by this work and make penetration watertight.
3. Install PVC pipe in dry weather when temperature is above 40 degrees F. in strict accordance with manufacturer's instructions. Allow joints to cure at least 24 hours at temperatures above 40 degrees F. before testing, unless recommended by manufacturer.

G. Sprinkler Heads: Flush station lines with full head of water and install heads after hydrostatic test is completed.
1. Locate part-circle heads to maintain a minimum distance of 4" from walls and 2" from other boundaries, unless otherwise indicated.

H. Dielectric Protection: Use dielectric fittings at connection where pipes of dissimilar metal are jointed.

3.04 TESTING:

A. General: Notify Architect in writing when testing will be conducted. Conduct tests in presence of Architect.

B. Hydrostatic Test: Test water piping and valves, before backfilling trenches, to hydrostatic pressure of not less than 100 psi. Piping may be tested in sections to expedite work. Remove and repair or replace piping, connections, valves which do not pass hydrostatic testing.

C. Operational Testing: Perform operational testing after hydrostatic testing is completed, backfill is in place, and sprinkler heads adjusted to final position. Demonstrate to Architect that system meets coverage requirements and that automatic controls function properly. Coverage requirements are based on operation of one circuit at a time.

D. After completion of grading and planting, carefully adjust sprinkler head locations and heights so they will furnish complete coverage.

3.05 CODES AND ORDINANCES

A. All material and operations shall conform to tall applicable codes and ordinances. It is the Contractor's responsibility to investigate and follow all regulations.

3.06 PERMITS AND FEES

A. The Contractor shall obtain, at his expense, all required permits and shall pay all required fees, including impact fees from local governments that may apply. Any penalties imposed due to failure to obtain any permit or pay any fee shall be the responsibility of the Contractor.

3.07 WARRANTY AND GUARANTEE

A. The Contractor shall furnish a certificate of warranty registration and a written guarantee of work and materials for a one year period from the date of final acceptance of the Irrigation System by the Owner and the Designer.

END OF SECTION 32 8420

SECTION 32 9000
LANDSCAPE WORK

SECTION 1 - GENERAL

1.1 RELATED DOCUMENTS:

A. The general provisions of the Contract, including General and Supplementary and General Requirements apply to the work specified herein.
B. Irrigation Performance - Section 32 8420.
C. Landscape Maintenance - Section 32 9700.

1.2 DESCRIPTION:

A. Provide all labor, equipment, materials and services necessary to complete the Work of this Section, including:

1. Providing, placing, grading topsoil and/or sand for landscape grading as indicated in the Drawings.
2. Providing and installing trees, shrubs, ground covers, and solid sod for landscape planting.
3. Maintenance for thirty days after Substantial Completion, and Two (2) Year Guarantee Period.

1.3 SUBMITTALS:

A. Qualification Data for firms specified in "Quality Assurance" article to demonstrate their capabilities and experience. Include a list of a minimum of five (5) similar projects completed with the last five (5) years with project name, address, names of Architects and Owners, overall description of scope of work, and contract value.

B. Materials Lists:

1. Within ten (10) days of award of Contract, submit a complete list of materials and unit prices demonstrating source, availability, and complete conformance with requirements specified.

2. Substitutions not permitted unless proof is submitted to the Landscape Architect's satisfaction that the material is unavailable as specified.

C. Certificates: Deliver all certificates of inspection to the Engineer.

D. Product Data:

1. Submit manufacturer's product literature, instructions and guaranteed analysis for fertilizer.

1.4 DEFINITIONS:

A. Trees, shrubs, groundcovers, and sod are plant materials listed in Plant Schedule on Drawings.

1.5 JOB CONDITIONS:

A. Coordinate the Work of this Section with that of other trades.

B. Examine conditions under which Work is to be performed and notify Landscape Architect and Landscape Architect in writing of unsatisfactory conditions.

C. Do not perform Work until conditions are satisfactory and acceptable.

D. Notify utility companies, prior to digging, for locations of underground utilities (electrical power, telephone, cable, water, sewer and gas) and perform Work in a manner which will avoid all possible damage. Hand excavate as required.

E. Maintain stakes or other location markers and controls set by others until removal is mutually agreed upon by all parties.

1.6 QUALITY ASSURANCE:

A. Codes and Standards:

1. Applicable Sections of Alabama Highway Department (ALDOT) Standard Specifications for Highway Construction, 2001 Edition as amended.

2. All plant materials to comply with State and Federal laws relating to inspection for disease and insect control.

3. Plant material quality to conform to *American Standard for Nursery Stock*, American Association of Nurserymen, Inc., 1986, ANSI Z-60.1.1

4. Plant Material nomenclature to conform to:

a. *Hortus Third*, a Concise Dictionary of Plants Cultivated in the United States and Canada, MacMillan Publishing Company, Inc., New York, 1976 Edition.

b. Names not listed in the above standard to comply with those most commonly used in the trade.

c. In all cases, botanical names take precedence over common names.

B. Installer Qualifications: Firm shall hold Alabama General Contractor's License for Classification S - Specialty Construction, Subclassification 4 - Landscaping. Firm experienced in the successful installation of a minimum of five (5) projects within the past five (5) years similar in scope, quality, and contract value to that indicated for this project. Firm shall have sufficient manpower, equipment and financial resources to complete the Work of this Section.

C. Personnel: Use adequate numbers of skilled workmen trained and experienced in the Work and familiar with requirements and methods needed for performance of the Work. At all times during planting operations, have on the site a person knowledgeable in horticultural practices as a superintendent.

D. Inspection and Approval:

1. All plant material is subject to inspection and approval in the field or nursery before digging, by the Landscape Architect.

2. All plant materials and other materials are subject to inspection and/or rejection at the site before planting or placing, or at any other time.

3. Attach secure, durable, legible waterproof labels, stating correct botanical and common names as specified, to a least one (1) plant, bundle or container of each plant variety.

4. Remove from site plant materials or other materials not complying with specified requirements within 5 days of rejection.

5. Approval is for visual qualities only and does not relieve the Contractor of his obligation to provide materials and workmanship in full compliance with the requirements of the Contract Documents.

1.7 PRODUCT DELIVERY, STORAGE and HANDLING:

A. Deliver packaged materials in manufacturer's original containers showing weight, analysis and name of manufacturer. Protect materials from deterioration during delivery, and while stored at the site.

B. Deliver all non-packaged or non-containerized materials to site in a manner that will prevent loss, damage, deterioration or contamination.

C. Store all materials in approved locations to prevent loss, damage, deterioration or contamination.

D. Deliver, storage and handling of all plant materials shall conform to ALDOT Specification Section 860.06(c) and the following:

1. Deliver freshly dug plants, which have not been in cold storage or heeled-in.

2. Do not prune prior to delivery.

3. Do not bend or bind trees or shrubs in such a manner as to damage bark, break branches or destroy natural shape.

4. Provide necessary protective covering during transport and delivery.

5. Deliver plants after preparations for planting have been completed and approved, and plant immediately.

1.8 SITE MAINTENANCE:

A. Keep roads, paving and structures adjacent to maintenance operations clean and free of obstructions, mud and debris at all times.

B. Do not permit flushing of roads or disposal of dirt or debris into sewers or drainage ditches.

C. Control dust from maintenance operations.

SECTION 2 - PRODUCTS

2.1 SOIL MATERIALS:

A. Topsoil:

1. This Contractor shall furnish topsoil in sufficient quantity, to complete grading and planting operations as specified.

2. Characteristics of topsoil to be furnished:

a. Fertile, friable, naturally occurring. Free of stones, clay, lumps, hardpan, roots, stumps, branches, sticks and other debris larger than two (2) inches in any dimension; free of noxious weeds, grasses, seeds, plants, extraneous matter and any substance harmful to plant growth. Topsoil from open fields will not be accepted.

b. Ph: 5.0 to 7.0
c. Organic Matter: 5% to 10%
d. Sand: 50% to 70%
e. Silt: less than 30%
f. Clay: 10% to 25%
g. Permeability Rate of 5 x 10 <-3> centimeters or greater at 85% compaction.

B. Notify Engineer of location of proposed topsoil for his inspection before testing or transporting to site.

C. Topsoil testing for furnished topsoil: Sample and test, minimum of three (3) samples, for compliance with specified characteristics. Tests to be performed by soil testing lab approved in advance by Engineer, by this Contractor at his expense. Submit Soil Test Reports to Landscape Architect for approval before transporting topsoil. Amend per recommendations of Soil Test Report and as approved to meet specified characteristics.

2.2 SOIL AMENDMENTS:

A. Fertilizer:

1. Characteristics:

a. Uniform in composition.
b. Dry and free-flowing.
c. Commercially available.
d. Conforming to the State of Federal Fertilizer Laws.

2. Of the formulation recommended in the Soil Test Report as specified.

B. Lime:

1. Ground or crushed agricultural lime.
2. Containing not less than 85% of total carbonates.
3. 90% passing 20-mesh screen.
4. Not less than 50% passing a 60-mesh screen.
5. Dry and free-flowing.
6. Apply at rate specified in Soil Test Report.

2.3 LANDSCAPE PLANTING MATERIALS:

A. Water:

1. Provide fresh water, free of impurities or any substance harmful to plant growth.

2. Provide all hose, attachments, and accessories necessary to complete the Work

as specified.

B. Topsoil: Refer to Paragraph 2.1.A, this Section, for specified topsoil for use in all planting operations.

C. Topsoil Mix:

1. Prepare all topsoil mix used in tree and shrub pits and ground cover beds in the following proportions:

a. 2 parts by volume topsoil as specified. 2.1.A.
b. 1 parts by volume decomposed organic matter, 2.3.E.

2. Add three (3) pounds of 12-6-6 fertilizer to each cubic yard of topsoil mix during the mixing process, for all plants.

D. Decomposed Organic Matter:

1. Well rotted organic matter.

2. Containing no weeds, grasses or plants, their seeds, or any substance harmful to plant growth.

3. Of uniform composition.

4. Acceptable Materials:

a. Mushroom Compost
b. Ground pine bark
c. Approved equal.

E. Mulch:

1. Pine straw on slopes: Free from leaves, twigs, insects, grasses, weeds, plants and their seeds, other foreign material and any substances harmful to plant growth.

2. Ground Pine bark: Free from leaves, twigs, insects, grasses, weeds, plants and their seeds, other foreign material and any substances harmful to plant growth.

F. Solid Sod:

1. Obtain solid sod from sources having growing conditions similar to the area to be planted.

2. Sod shall be true to name and type of the species named in the plant Schedule.

3. Sod shall be 100 percent of the type specified and shall contain no other grasses.

4. Sod shall be well cultivated and weed, disease and insect-free, of good texture, and free from extraneous roots, stones and other foreign material. The presence of nutgrass or other weeds shall be cause for rejection and replacement prior to Substantial completion, or during the Guarantee Period.

I. Plant Material:

1. Definition: Trees and shrubs listed in the Plant Schedule in the Drawings.

2. General:

a. Species, sizes, manner in which to be planted, and approximate quantities to complete the planting as indicated are included in the Plant Schedule.
b. Scientific and common plant names conform to those given in *Hortus Third*, or are those generally accepted in the nursery trade.

3. Quality:

a. Conform to the standards set forth in *American Standard for Nursery Stock.*
b. Standard quality and first-class representatives of their species or variety and true to name and type.
c. Nursery-grown, unless specified otherwise.
d. In compliance with State and Federal laws relating to disease and insect infestation; file certificates with Landscape Architect.
e. Having normal, well-developed branches and vigorous root systems, free from defects, decay, disfigurements, sun scaled, bark abrasions, plant diseases, insect pests or eggs, borers and any and all infestations.

4. Rejection of plants for:

a. Lack of compactness or proper proportion;
b. Week, thin growth in rows too close together;
c. Cut back from larger stock to meet specified requirements;
d. Undersized, dry, cracked or broken balls, or plants that are loose in their balls;
e. Root bound within container or ball;
f. Lacking proper proportion as to height and spread and specified characteristics or plant material;

5. Size:

   a. Sizes and proportions of all plant materials shall equal those recommended by the *American Standard for Nursery Stock* for specified grades.
   b. Measure plants before pruning, with branches in normal position.
   c. Equal or exceed measurements specified in Plant Schedule, which are the minimum acceptable; provide 50-percent of plant material maximum size specified.
   d. Height and spread dimensions: General body mass of plant, not from branch tip to tip.
   e. Well-proportioned as to height; reject plants which meet specified measurements but do not possess an overall balance.

   f. Take caliper measurement on trunk six-inches above natural ground level up to and including four-inch caliper size; twelve-inches above natural ground level for larger sizes.
   g. B&B plants shall have firm natural balls of a diameter and depth not less than that recommended in *American Standard For Nursery Stock.*
   h. Container-grown plants: Conform to standards set forth in *American Standard For Nursery Stock* for container-grown plants.

6. Quantity: Furnish plants in sufficient quantity to satisfy the intent of the Drawings and Specifications. Locate in sufficient quantity to that time is not lost if some plants are rejected.

J. Guying and Staking Materials:

1. Wood Stakes:

   a. Pressure-treated Southern Yellow Pine, or other approved wood, 2-inches x 4-inches x length specified in the Drawings, pointed at one end.
   b. Free from insects and fungi.

2. Wire: Pliable #10 or #12 gauge galvanized steel wire, doubled and twisted.

3. Turnbuckles: As detailed and approved by Landscape Architect.

4. Protective Hose:

   a. Reinforced fiber-bearing rubber hose.
   b. Black.
   c. May be second-hand.
   d. Not less than 2-inches inside diameter.

K. Steel Edging

1. Black polypropylene, 16 (mils.) thickness

a. Acceptable product: 10' x 14ga x 4" Commercial Edging, Manufacturer: Col-met, 3333 Miller Park South Garland, TX 75042 Tel.: (972)494-3900
b. Approved equal.

K. Weed Barrier Fabric

1. Black polypropylene, 16 (mils.) thickness

a. Acceptable product: Pro 5(20 yr, 5oz) Manufacturer: DeWitt Company Highway 61 South, RR3, Box 31, Sikeston, Missouri 63801
b. Approved equal.

SECTION 3 - EXECUTION

3.1 INSTALLATION:

A. Planting Season:

1. A period of acceptable weather conditions, during seasons in which satisfactory results can be expected as determined by acceptable practice in the locality and approved by the Landscape Architect.

2. Commence planting operations as soon as portions of the site are available, as approved by the Landscape Architect.

B. Site Inspection:

1. Examine areas and conditions under which Work is to take place.

2. Inform Landscape Architect in writing, prior to planting, of conditions existing which could be considered detrimental to the successful planting and growth of any plant material, including but not limited to, subsurface drainage conditions, utility locations, subgrade compaction, percolation rate and elevations.

C. Site Preparation:

1. Subgrade will be established by others at 2-inches below finished grade in all

areas to receive planting, and 1-inch for areas to be sodded, unless greater topsoil depth is indicated herein or on Drawings for deeper bed preparation.

a. Topsoil depth for shrub and groundcover beds is 6-inches and is by this Contractor (4" by others, 2" by this contractor).
b. Do not place or spread topsoil in an area until subgrade is approved by Landscape Architect and is acceptable to this Contractor.

2. Remove all vegetative growth from topsoil by approved means before commencing with planting operations.

3. Remove all unwanted vegetative growth from areas designated to receive new planting or sod with chemical herbicide or by other approved means, prior to scarifying and placing topsoil.

4. Remove extraneous matter measuring 1-2-inch or larger in any dimension from top 4-inches of placed topsoil.

5. Uniformly grade areas including adjacent transition areas to line and grade shown on Drawings.

6. Obtain approval of finished grades before proceeding with planting operations; eliminate irregularities and ponding.

7. Protect stockpiled or spread topsoil from erosion by force of wind, water, or other force; re-establish eroded, rutted or settled grades to proper finished grade.

D. Topsoil Mix:

1. Prepare topsoil mix to specification 2.3.C off site, using approved topsoil.

2. Obtain approval of topsoil mix before delivery to site, and prior to commencing planting operations. Do not mix in place with placed topsoil.

3. Place topsoil mix as backfill for tree and shrub pits and beds as drawn. Place 2-inches of topsoil mix in all shrub beds unless otherwise indicated on the Drawings.

4. Protect stockpiled topsoil mix from erosion by force of wind of water, or damaged by traffic.

E. Plant Location Staking:

1. Stake plant locations and areas for approval prior to planting.

2. Do not dig plant pits prior to obtaining Landscape Architect's approval of plant locations.

3. Make adjustments in plant locations as directed.

4. If underground obstructions are encountered in planting areas that would prevent the installation of the plant material, contact the Landscape Architect immediately. Alternate locations may be selected by the D & D at no additional cost to the Owner.

F. Planting:

1. Place plants comprising a planting composition in approved staked locates for approval by Landscape Architect.

2. Planting pits and beds:

a. Drainage:

1) This Contractor is responsible for achieving and maintaining adequate drainage from all planting beds. Use specified drainage system, or other approved means, in all tree pits.

2) 48-hours prior to planting, test each plant pit for adequate drainage.

3) Owner reserves the right to test tree or plant pits at any time, before or after planting, for adequate drainage. Correct immediately any inadequate drainage encountered.

b. Pits are generally circular in outline with vertical sides.
c. Tree pits: 3-feet greater in diameter than ball or root spread.
d. Shrub pits: 1-foot greater in diameter than ball or root spread.

e. Excavate to specified dimensions and dispose of excavated material off site.
f. Prepare as specified in detail Drawings.

3. Setting plants:

a. Set plants uniformly 2-inches to 4-inches higher than surrounding grade or as necessary to provide adequate positive drainage away from roots. Slope soil gradually from saucer.
b. Cut rope, wire or string from top of ball after plant has been set; turn down and bury burlap.

4. Backfilling plants:

   a. Backfill to 2/3 full with specified topsoil mix.
   b. Water thoroughly to eliminate air pockets and settling before filling to grade.
   c. Form shallow saucer at plant pit edge to hold water.
   d. Water in thoroughly.

5. Staking:

   a. Inspect tree trunks for injury, improper pruning and insect infestation; take corrective measure.
   b. Immediately after planting, stake trees as detailed.

6. Pruning:

   a. Do not prune plants without approval.
   b. Prune after plants are in place and *ONLY* at the direction of Landscape Architect.
   c. Main leaders of trees to remain intact.
   d. Paint all cuts over 2-inch diameter with approved tree wound dressing.

7. Finished Grading: Handgrade and rake planting areas so that grades conform to surrounding areas and surface water drains freely.

8. Mulching:

   a. Mulch all plant pits and beds with 4-inch deep specified mulch.
   b. Spread mulch solid in planting beds.
   c. Thickness is uniform throughout.
   d. Mulch for trees shall be eight (8) feet in diameter from base of tree.

G. Solid Sod:

1. Procure and handle sod per ALDOT Section 860.05(b) 1-4.

2. Preparation of Sod Bed:

   a. Spread and scarify amended topsoil as specified.
   b. Rake and otherwise manipulate to form smooth-draining grades, remove all stones and clay lumps 1-inch in diameter or larger.
   c. Leave the surface of the topsoil 1- 1/2-inches below finished grade.
   d. Do not move heavy objects over areas to be sodded after the soil has been prepared. Planting in compacted areas will not be permitted.

e. The finished surface of the areas to be sodded shall be approved by the Landscape Architect prior to sod placement.

3. Solid Sod Placement:

a. Lay sod when sod bed is not excessively wet or frozen, but when soil is damp for a depth of 4-inches.
b. Immediately upon approval of bed preparation, lay sod smoothly, edge-to-edge, with staggered joints.
c. Press firmly into contact with sod bed by tamping or rolling by approved means to eliminate all air pockets, providing a true and even surface, and assuring knitting.

d. Fill cracks between sod blocks with strips of living sod, topsoil, or humus.
e. Water thoroughly by use of sprinkler or spray, without erosive force.

3.2 LANDSCAPE MAINTENANCE:

A. Provide labor, materials, equipment and means for proper maintenance of all materials and workmanship included in the Work of this Section until Substantial Completion and the beginning of the 30-day maintenance period.

B. Maintenance for 30 days after Substantial Completion is included in the Work of this Section.

3.3 SUBSTANTIAL COMPLETION and GUARANTEE:

A. Substantial Completion and Payment:

1. Submit request for inspection of Substantial Completion, with a punch list of contract items to complete, to Landscape Architect at least 1-week prior to anticipated date of inspection.

2. Review the Work jointly with the Landscape Architect for Substantial Completion.

3. Upon completion of repairs and replacements found necessary at time of review, the Landscape Architect will confirm the Date of Substantial Completion of the Work.

4. Substantial Completion constitutes the beginning date of the 2-Year Guarantee Period per the city Landscape Ordinace.

B. Basis of Acceptance:

1. Planted trees and shrubs will be counted as individual units, complete, in place and planted in accordance with plans and specifications. Each unit will include the installed plant, topsoil, topsoil mix, mulch and staking apparatus.

2. Solid sod will be counted in square yards provided and installed, including sod, ground preparation and topsoil, in accordance with plans and specifications.

3. Plant pit drainage will be counted as incidental to the Work, and will not be counted separately for payment.

4. The cost of mobilization (including all provisions of General Requirements, and Maintenance until Substantial Completion as specified herein are considered incidental to the Work and will not be counted as separate items for payment.

C. Guarantee:

1. Guarantee all materials and workmanship for a period of 2-years from the Date of Substantial Completion.

2. During the period of the Guarantee, replace with no additional compensation, and as soon as weather permits, all dead plant materials and all materials not in a thriving condition; replace all other workmanship and materials which are unsatisfactory in the opinion of the Landscape Architect; make good any other damage, loss, destruction, or failure to flourish sufficiently as the result of inferior or defective materials or workmanship, including, but not limited to inadequate drainage.

3. All replacement material shall match the size attained by original materials at the time of the replacement.

4. Remove dead or dying material from the site within 5 days of notice, refer to section 1.6 paragraph F(4).

5. Repair grades and other Work necessitated due to planting replacements.

6. If the replacement is not acceptable during or at the end of the Guarantee Period, the Owner may elect either subsequent replacement or credit. Replacements shall have a 1-year Guarantee from date of replacement.

7. Guarantee applies to losses or damage other than those due to vandalism, Owner neglect, or Acts of Nature, as determined by the Landscape Architect. Acts of Nature, but may not be limited to, high winds of hurricane or tornado force, sleet, hail, freezing rain, and extreme cold (as determined by the Landscape Architect). Contractor agrees to replace losses due to Acts of Nature at fifteen

percent (15%) less than original contract price for the damaged work.

3.4 FINAL INSPECTION and ACCEPTANCE:

A. Contractor is responsible for contacting the Landscape Architect at the end of the Guarantee Period to schedule final inspection. Should the Contractor fail to contact the Landscape Architect at this time, the Guarantee Period is automatically extended until he does so.

B. At the end of the Guarantee Period, submit request for inspection for Final Acceptance to Landscape Architect at least 1-week prior to anticipated date of inspection; include list of Work substantially accepted and list of Work replaced during Guarantee Period.

C. Upon request for inspection, jointly review with Landscape Architect all guaranteed Work for Final Acceptance.

D. Remove tree staking apparatus and saucers from all trees, unless otherwise directed; replace mulch to specified thickness.

E. Upon completion by the Contractor of all required repairs and replacements, the Landscape Architect will confirm the date of Final Acceptance of the Work.

END OF LANDSCAPE WORK

SECTION 32 9700
LANDSCAPE MAINTENANCE

1.0 GENERAL

1.1 RELATED DOCUMENTS:

A. The general provisions of the Contract, including General and Supplementary Conditions, and General Requirements, apply to the work specified herein.

1.2 DESCRIPTION AND SCOPE OF WORK:

A. Provide all labor, products, equipment and services necessary to maintain site landscape work for TWO (2) YEARS after substantial completion.

B. Maintenance includes maintaining all landscape and site work as described herein; The removal of trash, litter, blowing paper, debris, dust and mud from landscape areas and other areas littered as a result of maintenance operations is included.

C. Maintain all plants in a growing, well formed, healthy, and thriving condition, by watering, fertilizing, pruning, spraying, weeding, straightening, replacement, or by other necessary maintenance operations.

1.3 SUBMITTALS:

A Qualification data for firms specified in "Quality Assurance" article to demonstrate their capabilities and experience. Include a list of a minimum of five (5) similar projects completed within the last five (5) years with project name, address, names of Architects and Owners, overall description of scope of work, and contract value.

B. Product Data:

1. Submit manufacturer's product literature, instructions and guaranteed analysis for fertilizer.

C. Maintenance Manual: In a 3-ring binder, typewritten schedule and procedures for annual landscape maintenance program and procedures, with monthly maintenance guidelines, by Contractor.

1.4 JOB CONDITIONS:

A. Coordinate the Work of this Section with that of other trades.

B Examine conditions under which Work is to be performed and notify Owner in writing of unsatisfactory conditions.

D. Determine the extent of underground utilities and impact on proposed installation and maintenance operations.

1.6 QUALITY ASSURANCE:

A. Codes and Standards:

1. All plant materials to comply with State and Federal laws relating to inspection for disease and insect control.

2. Plant material quality to conform to *American Standard for Nursery Stock*, American Association of Nurserymen, Inc., 1986, ANSI Z-60.1.

3. Plant Material nomenclature to conform to:

   a. *Hortus Third*, a Concise Dictionary of Plants Cultivated in the United States and Canada, MacMillan Publishing Company, Inc., New York, 1976 Edition.
   b. Names not listed in the above standard to comply with those most commonly used in the trade.
   c. In all cases, botanical names take precedence over common names.

4. Applicable Sections of the Alabama Department of Transportation (ALDOT) Standard Specifications for Highway Construction, 2001 edition.

B. Contractor Qualifications:

1. Alabama General contractors License for Classification S - Specialty Construction, Sub-classification 4 - Landscaping.

2. Firm experienced in the successful installation of a minimum of five (5) projects within the past five (5) years similar in scope, quality, and contract value to that indicated for this project. Firm shall have sufficient manpower, equipment and financial resources to complete the Work of this Section.

C. Supervision:

1. Scheduling, operations, installation, and maintenance shall be supervised by a person(s) having one or more of the following qualifications:

   a. Is a Certified Nurseryman.
   b. Is a Licensed Horticulturist.
   c. Has a State Setting and Maintenance License.

D. Inspection and Approval:

1. Immediately remove from site plant materials or other materials not complying with specified requirements.

2. Approval is for visual qualities only and does not relieve the Contractor of his obligation to provide materials and workmanship in full compliance with the requirements of the Contact Documents.

1.7 PRODUCT DELIVERY, STORAGE and HANDLING:

A. Deliver packaged materials in manufacturer's original containers showing weight, analysis and name of manufacturer. Protect materials from deterioration during delivery, and while stored at the site.

B. Deliver all non-packaged or non-containerized materials to site in a manner that will prevent loss, damage, deterioration or contamination.

C. Store all materials in approved locations to prevent loss, damage, deterioration or contamination.

D. Deliver, storage and handling of all plant materials shall conform to ALDOT Specification Section 860.06(c) and the following:

1. Deliver freshly dug plants, which have not been in cold storage or heeled-in.

2. Do not prune prior to delivery.

3. Do not bend or bind trees or shrubs in such a manner as to damage bark, break branches or destroy natural shape.

4. Provide protective covering during delivery.

5. Deliver plants after preparations for planting have been completed and approved, and plant immediately.

1.8 SITE MAINTENANCE:

A. Keep roads, paving and structures adjacent to maintenance operations clean and free of obstructions, mud and debris at all times.

B. Do not permit flushing of roads or disposal of dirt or debris into sewers or drainage ditches.

C. Control dust from maintenance operations.

SECTION 2.0 - PRODUCTS

2.1 WATER:

A. Owner provides potable water.

B. Contractor provides necessary hose, attachments, and accessories.

2.2 TOPSOIL:

A. Topsoil necessary to perform or complete maintenance operations, repair or replacement is to be provided by Contractor. Furnish from approved off-site source in sufficient quantity to complete all operations.

B. Prepare all topsoil used in tree and shrub pits and ground cover beds in the following proportions:

1. 2 parts by volume topsoil as specified.
2. 1 part by volume decomposed organic matter.

C. Add three (3) pounds of 12-6-6 fertilizer to each cubic yard of topsoil mix during the mixing process, for all plants.

D. Test at least three (3) samples for compliance.

E. Characteristics:

1. Fertile, friable, naturally occurring. Free of stones, clay, lumps, hardpan, roots, stumps, branches, sticks and other debris larger than two (2) inches in any dimension; free of noxious weeds, grasses, seeds, plants, extraneous matter and any substance harmful to plant growth. Topsoil from open fields will not be accepted.
2. pH: 5.0 to 7.0
3. Organic Matter: 5% to 10%
4. Sand: 50% to 70%
5. Silt: less than 30%
6. Clay: 10% to 25%
7. Permeability Rate of 5 x 10 <-3> centimeters or greater at 85% compaction.

2.3 SOIL AMENDMENTS:

A. Fertilizer:

1. Uniform in composition, dry and free flowing.
2. Commercially available.
3. Mixed per soil test report recommendations.
4. Acceptable Manufacturers:

    a. Sta-Green Plant Food Company; Nursery Special.
    b. O.M. Scott and Sons, Inc.; Scott's.
    c. W.R. Grace & Company; Peter's 20-20-20 (for deep root feeding trees).
    d. Approved substitution.

B. Lime:

1. Ground or crushed agricultural lime.
2. Containing not less than 85% of total carbonates.
3. 90% passing 20-mesh screen.
4. Not less than 50% passing a 60-mesh screen.
5. Dry and free flowing.
6. Apply at rate specified in Soil Test Report.

C. Decomposed Organic Matter:

1. Well rotted.
2. Containing no weeds, grasses or plants, their seeds, or any substance harmful to plant growth.
3. Of uniform composition.
4. Acceptable Manufacturers:

a. Klumb Company; "Soil Conditioner."
b. Approved equal.

2.4 MULCH:

A. Pine straw.

1. Free from wood, cambium, sawdust, leaves, twigs, insects, grasses or weeds, their seeds, other foreign material and any substance harmful to plant growth.

2.5 PLANT MATERIALS:

A. Plant Material:

1. Trees, shrubs and ground covers as shown and scheduled. Provide and install species, sizes and quantities shown and scheduled; standard quality, first-class representatives of each species or variety, true to name and type; nursery-grown, unless otherwise shown or scheduled.

2. Conforming to standards in American Standard for Nursery Stock.

3. Having normal, well-developed branches and vigorous root systems.

4. Complying with State and Federal laws for disease and insect infestation.

5. Healthy, vigorous, free from defects, decay, disfigurements, sun-scald injuries, abrasions of the bark, plant diseases, insect pests or eggs, borers, and all forms of infestations or objectionable disfigurements.

6. Reject plants lacking compactness or proper proportions, plants that are weak, thin or injured from too-close planting in nursery rows.

7. Plants which have been cut back from larger grades to meet certain specified requirements will be rejected.

8. Plants with undersized, dry, cracked, or broken balls, or which are loose in their balls will be rejected.

9. Balled and burlapped material: Root-pruned within last two (2) years.

10. Container-grown material: Grown for one (1) growing season in the container in which it is delivered; free from weeds and grasses. Root-bound material will be rejected.

11. Size:

a. In accordance with *American Standard for Nursery Stock*.
b. Measure plants before pruning, with branches in normal position.
c. All replacement material shall match the size attained by original materials at the time of replacement.

d. Height and spread dimensions: General body mass of plant, not from branch tip to tip.
e. Well-proportioned as to height; reject plants which meet specified measurements but do not posses an overall balance.
f. Take caliper measurement on trunk six-inches above natural ground level up to and including four-inch caliper size; twelve-inches above natural ground level for larger sizes.
g. Balled and burlapped plants shall have firm natural balls of a diameter and depth not less than per American Standard for Nursery Stock.

2.6 CHEMICAL WEED CONTROL:

A. Pre-Emergent (in bed areas):

1. Selective pre-emergent with no residual soil activity. Active ingredient: Trifluralin.
2. Commercially available.
3. Adhere to manufacturer's recommendations for strength, rate, and method of application.
4. Acceptable Manufacturers:

a. Elanco: Treflan.
b. Approved substitution.

B. Herbicide:

1. Non-selective post-emergent with no residual soil activity. Active ingredient: Isopropylamine salt of Glyphosate.
2. Commercially available.
3. Adhere to manufacturer's recommendations for strength, rate and method of application.
4. Acceptable Manufacturers:

a. Monsanto Agricultural Products Company: Round Up.
b. Approved substitution.

2.7 GUYING and STAKING:

A. Wood Stakes:

1. Pressure-treated Southern Yellow Pine or other approved wood, 2-inches x 4-inches x length specified in the Drawings, pointed at one end.
2. Aboveground portion painted black.
3. Free from insects and fungi.

B. Wire: Pliable #10 or #12 gauge galvanized steel wire, doubled and twisted.

C. Turnbuckles: As detailed and approved by Architect.

D. Protective Hose:

1. Reinforced fiber-bearing rubber hose.

2. Black.
3. May be second-hand.
4. Not less than ½-inches inside diameter.

2.8 SHRUB BED DRAINAGE:

A. Washed pea gravel for drainage fill.

B. Filter Fabric: SUPAC 5-P manufactured by Phillips Fibers Corporation, or approved substitution.

C. Corrugated perforated drainage tubing: Four-inch diameter corrugated polyethylene drainage tubing, wrapped in filter fabric.

1. Acceptable Product: ADS Drain Guard #472 manufactured by Advanced Drainage Systems, Inc.
2. Approved substitution.

SECTION 3.0 - EXECUTION

3.1 GENERAL:

A. Provide maintenance according to:

1. Guideline performance specifications herein.
2. Monthly maintenance guidelines herein.
3. Accepted horticultural practices and techniques.
4. Manufacturer's recommendations for material use.
5. Applicable State laws and local ordinances.

3.2 WATERING:

A. General Watering:

1. Water during early morning hours (2:00 am - 7:00 am).
2. Should irrigation system, or any portion of that system, fail to function, hand water until system is made functional again.
3. Do not over-water; water should never be allowed to stand in any areas for long periods of time.
4. Maintain uniform moisture in all planting areas during winter, especially when a freeze is expected.
5. Heavy clay soils hold moisture longer periods of time; sandy lighter soils drain rapidly and need to be watered more frequently.

B. Trees: Deep water all newly planted trees once every week during the summer, and the winter as necessary. This schedule should be adjusted to the amount of rain. However, unless it has rained at least ½-inches in twenty-four (24) hours, continue to deep water. Check trees monthly to determine if root ball is well drained. Take permanent corrective measures.

C. Shrubs: Water shrubs as necessary to maintain sufficient uniform moisture in bed; usually three

(3) to four (4) times weekly or more frequently if needed during the summer.

3.3 FERTILIZING:

A. Fertilize trees, shrubs and lawns per manufacturer's recommended rates in accordance with the monthly maintenance guideline herein.

B. Cultivate and water beds or pits thoroughly after application.

C. Adjust fertilizer in accordance with interim Soil Test Reports.

3.4 PRUNING:

A. Remove dead wood and sucker growth as it becomes evident.

B. Do not top or remove terminal growing point or 'leader' of any plant.

C. Review pruning practices with Architect before pruning any living portion of any plants.

D. Crape myrtles will be pruned ONLY as directed by owner’s representative.

E. Maintain height of evergreen hedges at 36”-42” height.

3.5 INSECT AND DISEASE CONTROL:

A. Maintain all plants and grass in a pest and disease-free condition by approved means.

B. Observe all applicable laws, statues, and ordinances regulating the purchase, use, application, and licensing for all pesticides.

C. Where possible, combine approved insecticide and fungicide to provide maximum protection for all plants.

D. Follow manufacturer's recommendations.

E. Observe all safety precautions.

F. Trees: Inspect for pests and diseases. Spray for insect and disease control only as infestations are noted. Control shall be specific.

G. Shrubs: If insect or disease infestation occurs, treat and continue treatment until complete eradication.

3.6 WEEDING:

A. Keep all lawn and planting areas weed free on a continuous basis by approved means.

B. Minimum weeding:

1. Two (2) applications of chemical pre-emergent spray, approved.
2. Five (5) applications (during growing season) of chemical contact spray (Round Up by Monsanto, or equal, approved).
3. One (1) day per month hand weed during the period of March 1st through September 30th; remove all visible weeds.

4. Weed to remove visible weeds during the winter.

3.7 SOD MAINTENANCE:

A. Mowing: Mow and edge lawn areas during the growing season, approximately April 1 through November 15 (year-round if overseeded with Winter Rye). Remove grass clippings from the site. Adhere to the following mowing schedule:
1. Mow and edge sod areas weekly as needed.
2. Change mowing directions to prevent rutting of grass.
3. Mowing heights: Bermuda -- 1"-1 ½"
Zoysia -- 1 ½"-2"
Fescue -- 2 ½"-3 ½"

All mowing operations are to be completed in one day.

B. Thatch Removal: Thatch removal shall occur once each year at all sod areas or as required by the Owner. Thatch shall be generally removed during early spring or mid-autumn. De-thatch using approved equipment for this purpose.

C. Core Aerating: Aeration of sod areas shall occur once each year during mid-spring or late summer using approved core aeration equipment, especially manufactured for this specific purpose. Remove cores from site.

3.8 MULCHING:

A. Keep planting areas neat and uniformly mulched to 3” depth on a continuous basis.

B. In addition to replacing and re-spreading mulch as necessary, completely replenish pine straw mulch in all planting areas twice each year in March and November.

C. Areas of dense ground cover, such as Asian jasmine do not require pine straw mulch.

3.9 STRAIGHTENING:

A. Maintain plants in their stable upright position and at the proper grade by straightening and tightening staking and guying apparatus, raising plants which have settled, and by other means.

3.10 CLEAN-UP:

A. Keep all planting areas neat, weeded and uniformly mulched on a continuous basis.

B. Clean-up adjacent walks and pavement where littered as a result of maintenance operations.

C. Remove trash and debris from surface of planting areas, whether as a result of maintenance operations or otherwise.

3.11 MONTHLY MAINTENANCE GUIDELINES:

A. January:
1. Prune trees and shrubs that have become too large or out-of-shape.
2. Inspect plants, shrubs and trees and remove any damaged or dead wood.
3. Inspect planting areas and remove any debris or litter.
4. Check staking and weather protection of first year plants.
5. Remove leaf and litter on all lawn areas weekly.
6. Mulch bed areas as needed to replenish mulch levels.
7. Spray herbicides on winter weeds around January 15th.
8. Take soil samples.
9. Transplant any trees and shrubs.
10. Replace any damaged or dead trees and shrubs.
11. Check moisture level in all planted areas and water if necessary.
12. Check drainage of planted areas, correct if excessive water persists.
13. Fertilize pansies every two weeks or as needed to maintain heavy growth and flowering. Use nitrate based fertilizer.
14. Mow lawn areas every ten days if overseeded with winter grass.

B. February
1. Prune trees and shrubs that have become too large or out-of-shape.
2. Inspect plants, trees and shrubs and remove any damaged or dead wood.
3. Inspect planted areas and remove any debris or litter.
4. Remove leaf and litter on all lawn areas weekly.
5. Apply pre-emerge herbicides to lawn to prevent crabgrass.
6. Apply pre-emerge herbicides to beds to prevent weeds.
7. Replace any damaged or dead trees or shrubs.
8. Check moisture level in all planted areas and water if necessary (weekly).
9. Protect plants susceptible to cold damage during excessive cold periods if possible.
10. Mow lawn area every ten days if overseeded with winter grasses.
11. Spot spray any existing weeds with Round-Up.
12. Establish a good edge on all bed areas.
13. Completely replace and replenish mulch in all planting areas.

C. March
1. Dethatch all lawn areas that have thatch build-up.
2. Mow and trim all lawn areas as needed.
3. Inspect plants, trees and shrubs and remove any damaged or dead wood.
4. Litter removal on all lawn areas.
5. Check moisture level in all planted areas and water if necessary (weekly).
6. Start pruning where necessary to maintain shape and form (do not shear).
7. All Liriope should be cut back to allow new growth to come out and remove winter damage to old growth.
8. Hand weed all bed areas as needed.
9. Deep-root feed all trees except pines (Peter's 20-20-20) as requested.
10. Completely replace and replenish mulch in all planting areas.

D. April
1. Fertilize all lawn areas with 32-3-12 analysis, with 50% slow release nitrogen, or equal to soil sample reports.

2. Lime lawn areas as per soil sample reports.
3. Mow and edge lawn areas weekly.
4. Fertilize shrubs, trees, groundcover area with Nursery Special by Sta-Green or equal.
5. Cultivate and weed all planted areas.
6. Inspect all planted areas and remove any dead plants and replace.
7. Inspect all plant material (shrubs and trees) and prune any dead limbs.
8. Spot spray any weed problem areas.
9. Clean up any litter on lawn.
10. Inspect all areas for insect and disease damage and treat as necessary (weekly).
11. Prepare bed areas for any annual color and plant after mid-April.
12. Remove any winter and/or early spring color after blooming.
13. Water lawns and planted areas as needed.
14. Prune shrubs after they have bloomed.
15. Inspect all plants and trees for insects and/or diseases and treat as necessary.
16. Prune hedges to keep shape and form as necessary.
17. Hand weed all bed areas as needed.
18. Apply preventive spray for lacebug and leafminer.
19. Plant annual color beds for summer.

E. May
1. Irrigate all planted and lawn areas as needed.
2. Mow and edge all lawn areas weekly.
3. Spot spray for weeds in planted and natural areas with Round-Up.
4. Weed all groundcover and bed areas as necessary.
5. Clean up litter on lawn and hard surface areas (weekly).
6. Inspect all lawn and planted areas for insects and/or disease and treat as necessary.
7. Prune shrubs and hedges as necessary to keep shape and form.
8. Apply selective herbicides for weed control particular to each variety of lawn.
9. Prune any damaged plants.

F. June
1. Irrigate all planted and lawn areas as needed.
2. Mow and edge all lawn areas weekly.
3. Trim all lawn areas as needed.
4. Spot spray for weeds in all planted areas with Round-Up.
5. Weed all groundcover and bed areas as necessary.
6. Clean up litter on all lawn areas.
7. Inspect all lawn and planted areas for insects and/or disease and treat as necessary.
8. Prune shrubs and hedges as necessary to keep shape and form.
9. Apply selective herbicides for weed control particular to each variety of lawn.
10. Fertilize lawn areas .
11. Fertilize all bed areas.
12. Hand weed all bed areas as needed.

G. July
1. Irrigate all planted and lawn areas as needed.
2. Mow and edge all lawn areas weekly.
3. Hand weed all bed areas as needed.
4. Spot spray with Round-Up on weeds in all planted areas where applicable.
5. Clean up litter on all hard surface and lawn areas weekly.

6. Inspect all lawn and plant areas for insect and/or disease and treat as necessary.
7. Prune shrubs and hedges as necessary to keep shape and form.
8. Check all bed areas for mulch replacement as needed.

H. August
1. Irrigate all planted and lawn areas as needed.
2. Mow and edge all lawn areas weekly.
3. Hand weed all bed areas as needed.
4. Spot spray with Round-Up on weeds in all planted areas where applicable.
5. Clean up litter on lawn areas weekly.
6. Inspect all lawn and plant areas for insect and/or disease and treat as necessary.
7. Prune shrubs and hedges as necessary to keep shape and form.
8. Fertilize all lawn areas in late August-early September with 8-8-25 analysis (low nitrogen).
9. Fertilize all groundcovers and bed areas.
10. Check all bed areas for mulch replacement as needed.

I. September
1. Irrigate all lawn and planted areas as necessary.
2. Mow and edge all lawn areas weekly.
3. Hand weed bed areas as needed.
4. Clean up litter on lawn areas.
5. Inspect all lawn and planted areas for insects and/or disease and treat as necessary.
6. Prune shrubs and hedges as necessary to keep shape and form.
7. Apply pre-emergent to all Bermuda or Zoysia lawns unless over seeding with Winter Rye.
8. Apply pre-emergent to all bed areas.
9. Apply lime if soil tests show pH is low on lawn areas.
10. Fertilize fall color beds.
11. Remove any summer color beds and replace with fall color.
12. Take soil test if necessary for lime and fertilizer requirements.

J. October
1. Mow and edge all lawn areas weekly.
2. Monitor water needs.
3. Clean up litter on all lawn areas.
4. Inspect all lawn and planted areas for insects and/or disease and treat as necessary.
5. Prune any damaged plants.
6. Remove leaves from all planted and lawn areas.
7. Plant pansies for winter color.
8. Replace and/or plant any new trees or shrubs.
9. Dethatch all lawn areas that have thatch build-up.

K. November
1. Clean up all litter and leaves on lawns.
2. Mow, edge and trim all lawn areas where applicable.
3. Check mulch in beds and replace where necessary after fall leaf drop. Replenish pine straw mulch.
4. Check all planted areas for water requirements.
5. Weed and cultivate beds for winter.

6. Winterize irrigation system.

L. December
1. Clean up all litter and leaves on lawns.
2. Mow, edge and trim all lawn areas where applicable.
3. Check all planted areas for water requirements.
4. Fertilize winter color beds with liquid fertilizer two times.

3.12 INSPECTION and ACCEPTANCE:

A. Monthly Review:

1. Submit a request for inspection of Maintenance Work to the Owner once a month from April through September and every two (2) months from October through March.

2. Review the previous month's work jointly with the Owner.

3. Submit a written log of fertilizer applications, and chemical insect, disease or weed control applications with each Application for Payment. This log will be a complete account of each fertilizer and chemical application performed within the month covered by that Application for Payment including date, time, weather conditions, and specific purpose and product of each application.

B. Basis of Acceptance:

1. Contractor is responsible for landscape maintenance work as specified herein and in keeping with acceptable horticultural practices.

2. During the period of the maintenance contract, replace with no additional compensation, and as soon as weather permits, all dead plant materials and all materials not in a thriving condition; replace all other workmanship and materials which are unsatisfactory in the opinion of the Owner; make good any other damage, loss, destruction or failure to flourish sufficiently as the result of inferior or defective materials or workmanship, including, but not limited to, inadequate drainage.

3. All replacement material shall match the size attained by the original material at the time of replacement.

4. Remove dead or dying material from the site within one (1) week of notice from the Owner.

5. Repair grades and other work necessitated due to planting replacements.

6. If the replacement is not acceptable during or at the end of the maintenance period, the Owner may elect either subsequent replacement or credit.

7. Responsibility for replacement or repair work applies to losses or damage other than those due to vandalism, Owner neglect, or Acts of Nature, as determined by the Owner. Acts of Nature include, but may not be limited to, high winds of hurricane or tornado force, sleet,

hail, freezing rain, and extreme cold (as determined by the Owner). Contractor agrees to replace losses due to Acts of Nature at fifteen percent (15%) less than original contract price for the damaged work.

8. The cost of mobilization (including the provisions of General Requirements and General and Supplementary Conditions) as specified herein is considered incidental to the Work and will not be counted as a separate item for payment.

3.13 FINAL INSPECTION and ACCEPTANCE:

A. At the end of the maintenance period, submit request for inspection for Final Acceptance to the Owner at least one (1) week prior to anticipated date of inspection.

B. Upon request for inspection, jointly review with Owner all Work for Final Acceptance.

C. Submit Maintenance Manual (three [3] copies) for Owner's information containing full details for care and maintenance of landscape work, personnel and procedures, and weekly schedule for maintenance.

D. Upon completion by the Contractor of all required repairs and replacements, the Owner will confirm the date of Final Acceptance of the Work.

END OF LANDSCAPE MAINTENANCE

SECTION 33 1000

WATER UTILITIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS:

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this Section.

B. Related work specified elsewhere includes:

1. Section 31 2000 - “Earth Moving”
2. Division 22 – Plumbing

1.2 SUMMARY:

A. This Section includes water service piping system, meter, vaults, valves, and appurtenances from the existing on-site utility source of potable water to a point 5 feet outside the building, and as indicated on the Drawings, and in this Section of the Project Manual.

B. Note that the Contractor shall furnish and install connection, water meter, etc., acceptable to the utility company and call on the utility company to approve the meter and inspect the installation prior to covering.

C. All fees and charges for water service, meters, taps, permits, impact fees, etc., if any, shall be paid by the Contractor from their contract amount.

D. The extent of water service piping system, fire hydrants, etc., is indicated on the Drawings, in this Section, other referenced Sections of the Project Manual, and as otherwise required by authorities having jurisdiction.

1. All water pipe which run under roads, streets, driveways, and other vehicular paving shall be sleeved in AWWA C151 ductile iron sleeves.

E. Utility Compliance: Comply with Authority Having Jurisdiction regulations and standards pertaining to water distribution systems.

1. Where conflicts or discrepancies occur with the plans or these specifications, Authority Having Jurisdiction regulations and standards shall govern.

1.3 SUBMITTALS:

A. General: Submit the following in accordance with conditions of Contract and Division 1 Specification Sections

1. Product data for water service piping and fire protection pipe and specialties.
2. Shop drawings for water vaults, including lids.

PART 2 - PRODUCTS

2.1 PIPE AND PIPE FITTINGS - GENERAL:

A. General: Pipe, valves, fittings and installation in R.O.W. and on site shall comply with requirements of this Section, other referenced Sections of the Project Manual, the Drawings, and the Authority Having Jurisdiction.

1. Pipe, fittings, hydrants and valves shall be as specified herein, subject to acceptance by the Authority Having Jurisdiction, unless other specific materials acceptable to the Authority Having Jurisdiction are indicated on the Drawings.

2. PVC piping and fittings 4" and smaller shall be C900 PVC, Class 200 plastic pipe, Schedule 40, or Type K Copper; and pipe 4" and larger, below paving and fire lines shall be ductile iron, of type(s) acceptable to the Authority Having Jurisdiction, unless other specific materials acceptable to the Authority Having Jurisdiction are indicated on the Drawings.

B. PVC Plastic, Schedule 40 PVC with pressure-rated fittings: Conform to ASTM D 1785 standard specifications for PVC plastic pipe.

C. PVC Plastic, Water Pipe: AWWA C900, Class 200. Include elastomeric seal according to ASTM F477.

1. Ductile Iron Fittings: AWWA C110, ductile-iron; or AWWA C153, ductile-iron, compact type, and specifically designed for joining PVC pipe; Include elastomeric seals according to ASTM F 477 or as otherwise required for joining plastic pipe specified

2. Plastic Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended in writing by piping system manufacturer, unless otherwise indicated.

D. Where copper pipe is indicated, provide Soft Copper Tube, ASTM B 88, Type K, water tube, annealed temper.

1. Copper, Solder-Joint Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper, solder-joint pressure type. Furnish only wrought-copper fittings if indicated.

E. Ductile-Iron, Push-on-Joint Pipe: AWWA C151 and ANSI C150, C151, A21.50, and A21.15 respectively, Class 350 as approved by the Authority Having Jurisdiction, tar coated outside, with cement lining and seal coat according to AWWA C104. Include rubber compression gasket according to AWWA C111.

1. Ductile-Iron, Push-on-Joint Fittings: AWWA C110, ductile-iron; or AWWA C153, ductile-iron, compact type. Include cement-mortar lining and seal coat according to

AWWA C104 and rubber compression gaskets according to AWWA C111 (ANSI 21.11) and according to ASTM D-3139.

2. Joining Materials: AWWA C111 rubber gaskets and lubricant according to ASTM F477 requirements.

F. Ductile-Iron, Mechanical-Joint Pipe: AWWA C151, with cement-mortar lining and seal coat according to AWWA C104. Include gland, rubber gasket, and bolts and nuts according to AWWA C111.

1. Ductile-Iron, Mechanical-Joint Fittings: AWWA C110, ductile-iron; or AWWA C153, ductile-iron, compact type. Include cement-mortar lining and seal coat according to AWWA C104 and glands, rubber gaskets, and bolts and nuts according to AWWA C111.

2. Joining Materials: AWWA C111 ductile-iron or gray-iron glands, high-strength steel bolts and nuts, and rubber gaskets.

G. PE Encasement for Ductile-Iron Piping: ASTM A 674 or AWWA C105, PE film, 0.008-inch (0.20-mm) minimum thickness, tube or sheet.

H. Pipe Sleeves: Provide pipe sleeves at least one size larger than water service piping required below existing concrete and paving, and as follows.

1. Below Concrete, Entry Pads, and Paving Subject to Only Pedestrian Traffic, and for Future Irrigation: Schedule 40 PVC.

2. Below Concrete, Equipment Pads, Dumpster Pads, Valley Gutters, Curbs and Gutters, Paving Subject to Vehicular Traffic, and Where Indicated: Ductile Iron, as specified above herein this Section.

I. Identification for Underground Plastic Pipe:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Allen Systems, Inc.; Reef Industries, Inc.
b. Brady (W.H.) Co.; Signmark Div.
c. Calpico, Inc.
d. Carlton Industries, Inc.
e. EMED Co., Inc.
f. Seton Name Plate Co.

2. Plastic Underground Warning Tapes: Polyethylene plastic tape with metallic core, 6 inches wide by 4 mils thick, solid blue in color with continuously printed caption in blue letters "CAUTION - WATER LINE BURIED BELOW."

PART 3 - EXECUTION:

3.1 INSTALLATION:

A. Comply with requirements of Division 22, the International Plumbing Code, Drawings, the Authority Having Jurisdiction and requirements of other authorities having jurisdiction.

B. Comply with requirements of the State Health Department, the local Health Department, and authorities having jurisdiction.

3.2 DEPTH OF COVER:

A. Provide minimum cover of 36-inches for all water bearing piping.

3.3 INSTALLATION OF IDENTIFICATION:

A. Install continuous plastic underground warning tape during back-filling of trench for underground water service piping. Locate 6 to 8 inches below finished grade, directly over piping.

3.4 CLEANING:

A. Clean and disinfect water distribution piping as follows, or as required by utility company, Code, and authorities having jurisdiction:

1. Purge all new water distribution piping systems and parts of existing systems that have been altered, extended, or repaired, prior to use.

2. Use the purging and disinfecting procedure prescribed by the authority having jurisdiction or, in case a method is not prescribed by that authority, use the procedure described in AWWA C651, or as described below:

a. Fill the system or part thereof with a water/chlorine solution containing at least 50 parts per million of chlorine. Isolate (valve off) the system or part thereof and allow to stand for 24 hours.

b. Drain the system or part thereof of the previous solution and refill with a water/chlorine solution containing at least 200 parts per million of chlorine and isolate and allow to stand for 3 hours.

c. Following the allowed standing time, flush the system with clean, potable water until chlorine does not remain in the water coming from the system.

d. Submit water samples in sterile bottles to the authority having jurisdiction. Repeat the procedure if the biological examination made by the authority shows evidence of contamination.

B. Prepare reports for all purging and disinfecting activities, and submit for review and along with each set of “Record Documents”.

END OF WATER SERVICE PIPING

SECTION 33 3000

SANITARY SEWERAGE UTILITIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS:

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this Section.

B. Related work specified elsewhere includes:

1. Section 31 2000 - “Earth Moving”
2. Section 03 3100 - “Concrete”
3. Division 22 - “Plumbing”

1.2 SUMMARY:

A. This Section includes sanitary sewerage system piping and appurtenances from a point 5 feet outside the building to the point of disposal.

B. The extent of sanitary sewerage system is indicated on the Drawings, in this Section 33 3000, and as otherwise required by authorities having jurisdiction.

C. All fees and charges for sanitary sewerage service, taps, connections, permits, impact fees, etc., shall be paid by the Contractor from their contract amount.

1.3 SUBMITTALS:

A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specification Sections.

1. Product data for drainage piping and specialties.
2. Test Reports.

1.4 QUALITY ASSURANCE:

A. Environmental Compliance: Comply with applicable portions of local environmental agency regulations pertaining to sanitary sewerage systems.

B. Utility Compliance: Comply with Authority Having Jurisdiction regulations and standards pertaining to sanitary sewerage systems.

1. Where conflicts or discrepancies occur with the plans or these specifications, the Authority Having Jurisdiction regulations and standards shall govern.

C. Health Department Compliance: Comply with the State Department of Health Code or the local Health Department code, regulations and standards, whichever is more stringent.

D. Comply with requirements of authorities having jurisdiction, when more stringent than specified or otherwise indicated.

1.5 PROJECT CONDITIONS:

A. Site Information: Perform site survey, research public utility records, and verify existing utility locations. Verify that sanitary sewerage system piping may be installed in compliance with original design and referenced standards.

1.6 SEQUENCING AND SCHEDULING:

A. Coordinate any connection to public sewer with the Authority Having Jurisdiction.

B. Coordinate with interior building sanitary drainage piping.

C. Coordinate with other utility work.

PART 2 - PRODUCTS

2.1 MANUFACTURERS:

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Cleanouts:
   a. Ancon, Inc.
   b. Josam Co.
   c. Smith (Jay R.) Mfg. Co.
   d. Wade Div.; Tyler Pipe.
   e. Zurn Industries, Inc.; Hydromechanics Div.

2. Underground Warning Tapes:
   a. Allen Systems, Inc.; Reef Industries, Inc.
   b. Brady (W.H.) Co.; Signmark Div.
   c. Calpico, Inc.
   d. Carlton Industries, Inc.
   e. EMED Co., Inc.
   f. Seton Name Plate Co.

2.2 PIPE AND FITTINGS:

A. Ductile-Iron, Gravity Sewer Pipe and Fittings:

1. Pipe: Ductile iron pipe meeting AWWA C-150, C-151 and ANSI A21-50 and A 21.15 for coated outside and cement lined inside. Cement lining according to AWWA C104, Class 350.

2. Standard Fittings: AWWA C110, ductile or gray iron, for push-on joints.
3. Compact Fittings: AWWA C153, for push-on joints.
4. Gaskets: AWWA C111, rubber.

B. PE Encasement for Ductile-Iron Piping: ASTM A 674 or AWWA C105, PE film, 0.008-inch (0.20-mm) minimum thickness, tube or sheet.

C. Identification for Underground Plastic Pipe:

1. Plastic Underground Warning Tapes: Polyethylene plastic tape with metallic core, 6 inches wide by 4 mils thick, solid yellow in color with continuously printed caption in red letters "CAUTION - SANITARY SEWER LINE BURIED BELOW."

2.3 CLEANOUTS:

A. General: Provide Mission adjustable repair coupling (or approved equal) with stainless steel bends and stainless-steel shear ring and a Zurn #ZN1400HD-3, Smith 4220 (or approved equal) cover set flush in a minimum 14" square concrete slab.

2.4 IDENTIFICATION:

A. Plastic Underground Warning Tapes: Polyethylene plastic tape with metallic core, 6 inches wide by 4 mils thick, solid green in color with continuously printed caption in black letters "CAUTION - SEWER LINE BURIED BELOW."

PART 3 - EXECUTION

3.1 PREPARATION OF FOUNDATION FOR BURIED SANITARY SEWERAGE SYSTEMS:

A. Grade trench bottom to provide a smooth, firm, stable, and rock-free foundation, throughout the length of the pipe.

B. Remove unstable, soft, and unsuitable materials at the surface upon which pipes are to be laid, and backfill according to provisions in Section 31 2000 – Earth Moving.

C. Shape bottom of trench to fit bottom of pipe. Fill unevenness with tamped sand backfill. Dig bell holes at each pipe joint to relieve the bells of all loads and to ensure continuous bearing of the pipe barrel on the foundation.

3.2 PIPE APPLICATIONS FOR UNDERGROUND SANITARY SEWERS:

A. Refer to Paragraph 2.2 above.

3.3 INSTALLATION, GENERAL:

A. General Locations and Arrangements: Drawings (plans and details) indicate the general location and arrangement of the underground sanitary sewerage system piping. Location and arrangement of piping layout take into account many design considerations. Install the piping as indicated, to the extent practical.

B. Install piping beginning at low point of systems, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install gaskets, seals, sleeves, and couplings in accordance with manufacturer's recommendations for use of lubricants, cements, and other installation requirements. Maintain swab or drag in line and pull past each joint as it is completed.

C. Use fittings for changes in direction. Use fittings for branch connections, except where direct tap into existing sewer is indicated.

D. Use proper size increasers, reducers, and couplings, where different size or material of pipes and fittings are connected. Reduction of the size of piping in the direction of flow is prohibited.

E. Install piping pitched down in direction of flow, at minimum slope of 1 percent, except where indicated otherwise.

F. Extend sanitary sewerage system piping to connect to building sanitary drains, of sizes and in locations indicated.

G. Tunneling: Install pipe under streets or other obstructions that cannot be disturbed, by tunneling, jacking, or a combination of both.

3.4 PIPE JOINT CONSTRUCTION AND INSTALLATION:

A. Join and install ductile iron pipe per ALDOT Standard Specifications.

3.5 CLEANOUTS:

A. Install cleanouts and extension from sewer pipe to cleanout at grade as indicated. Set cleanout lid in concrete block 14 by 14 by 12 inches deep, except where location is in concrete paving. Set top of cleanout 1 inch above surrounding earth grade or flush with grade when installed in paving.

3.6 TAP CONNECTIONS:

A. Make connections to existing piping and underground structures so that finished work will conform as nearly as practicable to the requirements specified for new work.

B. When tapping into existing man holes, use flexible rubber boot in accordance with authority having jurisdiction's requirements.

C. Use commercially manufactured wye fittings for piping branch connections. Remove section of existing pipe, install wye fitting into existing piping, and encase entire wye fitting plus 6-inch overlap, with not less than 6 inches of 3000-psi 28-day compressive-strength concrete.

D. Make branch connections from side into existing 4- to 21-inch piping by removing section of existing pipe and installing wye fitting, into existing piping. Encase entire wye with not less than 6 inches of 3000-psi 28-day compressive-strength concrete.

1. Provide concrete that will attain minimum 28-day compressive strength of 3000 psi, unless otherwise indicated.
2. Use epoxy bonding compound as interface between new and existing concrete and piping materials.

E. Protect existing piping and structures to prevent concrete or debris from entering while making tap connections. Remove debris, concrete, or other extraneous material that may accumulate.

3.7 INSTALLATION OF IDENTIFICATION:

A. Install continuous plastic underground warning tape during back-filling of trench for underground water service piping. Locate 6 to 8 inches below finished grade, directly over piping.

3.8 FIELD QUALITY CONTROL:

A. Testing: Perform testing of completed piping in accordance with local authorities having jurisdiction.

B. Cleaning: Clear interior of piping and structures of dirt and other superfluous material as work progresses. Maintain swab or drag in piping and pull past each joint as it is completed.

1. In large, accessible piping, brushes and brooms may be used for cleaning.
2. Place plugs in ends of uncompleted pipe at end of day or whenever work stops.
3. Flush piping between manholes, if required by local authority, to remove collected debris.

C. Interior Inspection: Inspect piping to determine whether line displacement or other damage has occurred.

1. Make inspections after pipe between manholes and manhole locations has been installed and approximately 2 feet of backfill is in place, and again at completion of project.
2. If inspection indicates poor alignment, debris, displaced pipe, infiltration or other defects correct such defects, and reinspect.

END OF SANITARY SEWERAGE UTILITIES

SECTION 33 4001

STORM DRAINAGE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS:

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this Section.

B. Related work specified elsewhere includes:

.. Section 31 2000 - "Earth Moving"
.. Section 03 3000 - "Cast-In-Place Concrete"

1.2 DESCRIPTION OF WORK:

A. Work described in this section includes the construction of new storm drainage pipe and structures as shown on the Drawings

1.3 QUALITY CONTROL:

A. Certifications: The Contractor shall submit to the Architect copies of certificates from suppliers of pipe, gaskets, reinforcing steel, cast iron downspout boots, cast iron frames, covers and grates, ready-mix concrete and other manufactured items, certifying that these products comply with the specifications and standards listed hereinafter.

B. Standard Specifications: Unless otherwise noted, all specifications referred to shall be the Alabama Department of Transportation (ALDOT) Standard Specifications for Highway Construction, 2014 Edition or most current edition.

C. Testing: All laboratory and field testing as required to ensure compliance with these specifications will be performed by an independent testing laboratory.

D. Comply with requirements of the International Plumbing Code, the American Concrete Pipe Association, and authorities having jurisdiction, when more stringent than specified or otherwise indicated

PART 2 - PRODUCTS

2.1 MATERIALS:

A. Where indicated, pipe smaller than 12-inches in diameter shall be Schedule 80 PVC, Contech A2000 PVC (or approved equal), or ADS N-12 HP HDPE, unless otherwise indicated on the drawings.

1. Where indicated on the Drawings for "french drain" or "perforated underdrain", pipe shall be equivalent to ADS N-12 (perforated) corrugated HDPE pipe with smooth interior or perforated Contech A2000 PVC, complete with filter fabric "sock" and all required or necessary system accessories, fittings, and components, as specified in Article 853.13.

B. Pipe larger than 12-inches (or equivalent area in arch pipe) shall be Class 3, minimum reinforced concrete pipe (RCP) as specified in Article 850, or as indicated on the Drawings.

C. Concrete and reinforcing steel for headwalls, inlets, manholes, and other storm drainage structures shall comply with Alabama Department of Transportation Specification Section 501, and Section 502. Concrete shall be Class "A", Type 2 (3,000 psi).

D. Masonry materials and precast concrete units shall conform to Article 621.02.

E. Castings for frames, covers and grates in drainage structures shall comply with ALDOT Section 836, with particular attention directed to ALDOT Article 836.04, 836.05, 836.06, and 836.07.

1. All manhole covers shall be round.

F. Identification for Underground Plastic Pipe:

1. Plastic Underground Warning Tapes: Polyethylene plastic tape with metallic core, 6 inches wide by 4 mils thick, solid yellow in color with continuously printed caption in black letters "CAUTION – STORM SEWER LINE BURIED BELOW."

2. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Allen Systems, Inc.; Reef Industries, Inc.
b. Brady (W.H.) Co.; Signmark Div.
c. Calpico, Inc.
d. Carlton Industries, Inc.
e. EMED Co., Inc.
f. Seton Name Plate Co.

PART 3 - EXECUTION

3.1 STORM DRAIN PIPE:

A. Construction requirements, including excavation of trench, placing pipe, and backfilling around pipe shall conform to the applicable portions of Article 530.03 of the Alabama Department of Transportation specifications.

B. Bedding for storm pipe shall be as shown on the Drawings and as per the pipe manufacturer's requirements, Type 3 or better installation. Open graded stone, such as #57 stone, is not allowed as backfill.

C. Compaction requirements for backfill shall be the same as specified for type of surface constructed over the trench, paved or planted areas as described in Section 31 2000 - "Earth Moving."

D. Properly coordinate with elevations of grades, footings, other below grade work, and etc.

3.2 INSTALLATION OF IDENTIFICATION:

A. Install continuous plastic underground warning tape during back-filling of trench for underground water service piping. Locate 6 to 8 inches below finished grade, directly over piping.

3.3 STRUCTURES:

A. Inlets, manholes, cleanouts and other storm drainage structures shall be installed or constructed in accordance with applicable portions of the following sections of the Alabama Highway Department Standard Specifications:

1. Section 501 - Structural Portland Cement Concrete.
2. Section 502 - Steel Reinforcement.
3. Section 613 - Brick and Concrete Block Masonry.
4. Section 620 - Minor Structure Concrete.
5. Section 621 - Inlets, Junction Boxes, Manholes and Miscellaneous Drainage Structures.
6. Section 622 - Resetting Gratings and Covers and for Catch Basins, Inlets, and Manholes.

RE: REPORT OF GEOTECHNICAL EXPLORATION
ALABAMA DEPARTMENT OF HUMAN RESOURCES
DHR – HOUSTON COUNTY
DOTHAN, HOUSTON COUNTY, ALABAMA
GMC PROJECT NO. GMGM250037

Dear Ms. Hart,

Goodwyn Mills Cawood, LLC (Geotechnical & Construction Services Division) is pleased to provide this report of geotechnical exploration performed for the above referenced project. This report includes the results of field and laboratory testing and general recommendations for foundation design and sitework.

We appreciate the opportunity to perform this study during this phase of the project for you and look forward to continued participation during the construction phase of this project. If you have any questions pertaining to this report, or if we may be of further service, please do not hesitate to call.

Sincerely,
GOODWYN MILLS CAWOOD, LLC

1.0 EXECUTIVE SUMMARY

A geotechnical exploration has been conducted for the proposed Alabama Department of Human Resources (DHR) Office Building to be located on Prevatt Road in Dothan, Houston County, Alabama. The proposed site is currently adjacent (east) to the existing DHR Office Building which is located at the southwest corner of U.S. 431 and Prevatt Road.

We have been provided with a preliminary site outline; however, detailed grading and structural information have not been provided at the time of this report. The site has been previously developed and is relatively level. We understand that the proposed office building will be approximately 45,000 square feet. We anticipate future building and parking grades to be within approximately 5 feet of current site elevations. Likewise, we have assumed maximum column and wall loads of 150 kips and 4 kips/foot, respectively, and construction will be masonry (CMU) type with steel joists.

- A total of seventeen (17) soil test borings were drilled at the site. Six (6) borings were drilled in the proposed building footprint to a depth of 20 feet each. Eleven (11) borings were drilled in the planned parking and drive areas to a depth of 10 feet each.
- The borings initially encountered 4 to 9 inches of organic-laden material (topsoil) across the site.
- The borings predominantly encountered approximately 2 to 3 feet of existing fill material generally classified very loose to medium silty sand (SM). Standard Penetration Test (SPT) N-Values in these materials ranged from 0 to 10 blows per foot (bpf).
- Below the existing fill materials, the borings typically encountered varying layers of very loose to dense clayey sand (SC) and very soft to hard sandy lean clay (CL) to the boring termination depths. The borings generally encountered soils with more clay and higher consistency with increasing depth below the surface. SPT N-Values in these materials ranged from 2 to 35 bpf.
- Groundwater was not encountered at the time of drilling.
- The site should be suitable for development, provided it is prepared herein. The main development issue for this site will be the low consistency soils (SPT N-values ‹ 8 bpf) and existing fill in the upper 4 to 6 feet of the existing subgrade elevation.
- **We recommend an allowance for the removal and replacement of approximately 4 feet of unsuitable materials within the building footprint and 2 feet within the pavement areas be included in the bid documents.** The undercut area should extend ten (10) feet beyond the building and five (5) feet beyond the parking areas.
- An additional option of geotextile and stone should also be considered and budgeted as well, if pavement areas require further stabilization beyond the upper two (2) feet.
- We recommend that conventional shallow foundations should be sized for a maximum allowable bearing capacity of 2,000 pounds per square foot (psf). The foundations should bear at a minimum depth of 18 inches below the proposed final exterior grade in the medium to stiff naturally occurring soils or newly placed compacted fill material.

The following sections provide additional detailed recommendations. The recommendations presented herein have been developed on the basis of the subsurface conditions encountered during field investigation and our understanding of the proposed construction. Should changes in the project criteria occur, a review must be carried out by GMC to determine if modifications to our recommendations will be required.

2.0 PROJECT INFORMATION AND SCOPE OF WORK

2.1 Project Information

A geotechnical exploration has been conducted for the proposed Alabama Department of Human Resources (DHR) Office Building to be located on Prevatt Road in Dothan, Houston County, Alabama. The proposed site is currently adjacent (east) to the existing DHR Office Building which is located at the southwest corner of U.S. 431 and Prevatt Road.

We have been provided with a preliminary site outline; however, detailed grading and structural information have not been provided at the time of this report. The site has been previously developed and is relatively level. We understand that the proposed office building will be approximately 45,000 square feet. We anticipate future building and parking grades to be within approximately 5 feet of current site elevations. Likewise, we have assumed maximum column and wall loads of 150 kips and 4 kips/foot, respectively, and construction will be masonry (CMU) type with steel joists.

2.2 Scope of Work

The purpose of this exploration was to perform a general evaluation of the subsurface soil conditions at the site and to provide general sitework, pavement, and foundation recommendations. The scope of the exploration and evaluation included drilling a total of seventeen (17) soil test borings. Six (6) borings were drilled in the proposed building footprint to a depth of 20 feet each. Eleven (11) borings were drilled in the planned parking areas to a depth of 10 feet each. It also included an engineering evaluation of the materials encountered.

The scope of services for the geotechnical study did not include any environmental assessment for the presence or absence of wetlands or hazardous or toxic materials in the soil, surface water, groundwater, or air, on or below or around this site. Any statements in this report or on the boring records regarding odors, colors, or unusual or suspicious items or conditions are strictly for the information of the client.

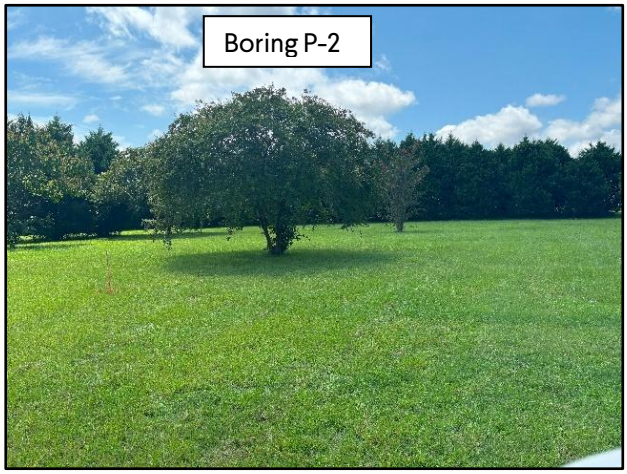
3.0 FIELD EXPLORATION AND LABORATORY TESTING

3.1 Field Exploration

The boring locations and depths were selected by GMC personnel. Field testing employed by GMC was performed in general accordance with ASTM standards or generally accepted methods. The borings were located in the field by GMC personnel.

The borings were performed on August 13, 2025 using a Geoprobe 7822 drill rig equipped with a rotary head and hollow stem augers (HSA). Soils were sampled using a two-inch OD split barrel sampler in accordance with ASTM D1586 driven with an automatic hammer.

3.2 Laboratory Testing



The laboratory testing program included visual classification of all soil samples and laboratory tests consisting of natural moisture contents, grain size analyses, and Atterberg limits tests. The laboratory testing program was conducted in accordance with applicable ASTM Standards, and the results are indicated on the Boring Records and summarized in the Appendix.

4.0 SITE AND SUBSURFACE CONDITIONS

4.1 General

At the time of this study, the proposed site was located on the south side of Prevatt Road approximately 700 feet east of its intersection with U.S. 431. The site currently includes a residential house with typical landscaping as well as other landscaped areas including short grasses and trees/bushes. The site slopes gently downward from the northwest corner to the southeast corner. Current topographic maps indicate site elevations range from EL 332 feet (SE Corner) to EL 345 feet (NW Corner). The photos below show the site at the time of our investigation.

4.2 Site Geology

Published geologic information indicates that the site is underlain by Residuum consisting of the Claiborne/Jackson Group of the Eocene-Oligocene Age. The primary constituency of this formation is clay or mud, with others consisting of sand, limestone, and chert. White to moderate-reddish-orange locally mottled sandy clay and residual clay with scattered layers of gravelly medium to coarse sand, fossiliferous chert and limestone boulders and limonitic sand masses are observed.

4.3 Subsurface Conditions

Surficial Materials
The borings initially encountered 4 to 9 inches of organic laden material (topsoil) across the site.

Existing Fill Materials
The borings predominantly encountered approximately 2 to 3 feet of existing fill material generally classified very loose to medium silty sand (SM). Standard Penetration Test (SPT) N-Values in these materials ranged from 0 to 10 blows per foot (bpf). It is likely that this material was placed during the original construction and grading of the existing residential house lot.

Residual Materials
Below the existing fill materials, the borings typically encountered varying layers of very loose to dense clayey sand (SC) and very soft to hard sandy lean clay (CL) to the boring termination depths. The borings generally

encountered soils with more clay and higher consistency with increasing depth below the surface. SPT N-Values in these materials ranged from 2 to 35 bpf. Auger refusal was not encountered in the borings.

The subsurface descriptions contained herein are of a generalized nature to highlight the major soil stratification features and soil characteristics. The boring records included in the Appendix should be reviewed for specific information as to individual boring location. The stratification shown on the boring records represents conditions only at the actual boring location. Variations may occur and should be expected across the site. The stratifications represent the approximate boundary between subsurface materials, and the transition may be gradual.

4.4 Groundwater Information

Groundwater was not encountered in the borings at the time of drilling. The borings were backfilled prior to leaving the site for safety reasons and therefore no long-term groundwater levels were recorded. It is important to note that the groundwater levels may not have stabilized in the borings. Furthermore, groundwater levels may vary due to seasonal conditions and recent rainfall.

5.0 SITEWORK RECOMMENDATIONS

5.1 General

The site should be suitable for development, provided it is prepared herein. The main development issue for this site will be the low consistency soils (SPT N-values ‹ 8 bpf) and existing fill in the upper 4 to 6 feet of the site. These soils should be remediated by removal and either replacement or recompaction to provide a suitable subgrade for foundations, slab support, and pavements.

5.2 Sitework Recommendations

Clearing and Stripping

Sitework should begin with clearing and grubbing of the site and should include the removal of the organic laden material, deleterious material, and asphalt pavement. All existing underground utilities and foundations to be abandoned in the planned construction areas should be removed and properly backfilled with structural fill material. We recommend a minimum of 10-inches of stripping be budgeted for this site.

Low Consistency Soils

The borings encountered existing fill materials and residual soils consisting of very loose to loose clayey and silty sands (SC and SM) and very soft to soft sandy lean clay (CL) in the upper 4 to 6 feet of the site. These soils, if left in place, could result in settlement of foundations and pavements above generally acceptable tolerable limits.

If foundations or pavements are to be located in these materials, we recommend these soils be evaluated and remediated to provide a stable bearing surface. Loose or soft soils may be moisture conditioned and compacted per Section 5.5 of this report or undercut to suitable material. All subgrade soils should be evaluated by a geotechnical engineer or his representative to determine suitability prior to fill placement or building construction. **We recommend an allowance for the removal and replacement of approximately 4 feet of unsuitable materials within the building footprint and 2 feet within the pavement areas be included in the bid documents.** The undercut area should extend ten (10) feet in the building and five (5) feet beyond the parking

areas. Prior to undercutting, the site should be stripped and cut to the subgrade elevation, compacted, and proofrolled as noted below.

Undercut soils may be stockpiled and re-used as structural fill material, if they are free of deleterious materials and meet the specifications of Section 5.5 of this report. We anticipate that these soils will require moisture conditioning to be able to be reused. Additional testing of these soils would be required.

Proofrolling

Once the site is at grade and prior to the placement of any new fill, the areas should be proofrolled with repeated passes of a loaded tandem axle dump truck to locate deeper soft soils. Soils that are observed to rut or deflect excessively under the moving load should be undercut and replaced with properly compacted fill. The proofrolling, undercutting, and filling activities should be witnessed by a qualified representative of the geotechnical engineer and should be performed during a period of dry weather.

We anticipate that recompaction of the surface soils will be required. Attempts can first be made to compact the problem soils. If dry weather conditions exist prior to and at the time of construction, re-compaction and densification may prove successful. The soils should be scarified and the soil moisture should be adjusted to within 3 percent of optimum moisture for low plasticity soils. Once proof rolling has been accomplished, then re-compaction of the soils may be attempted. In pavement areas where unsuitable soils are encountered, stabilization using geotextile or geogrid with stone may be a more economical option than removal and replacement of the soils.

5.3 Time of Year Site Preparation Considerations

The time of the year that the sitework begins can affect the project considerably. In this area, the "wet" season is generally between the months of November to April, and the "dry" season from May to October. There are many considerations that need to be addressed prior to bidding a project that could affect the budget based on the time of year a project starts earthwork activities. The time of the year that the geotechnical borings were performed can provide a false sense of actual near surface conditions depending on the time of year and weather conditions. Below are considerations that should be addressed based on the time of the year earthwork is started.

"Wet" Season

During the "wet" season, the amount of undercutting may be greater, therefore resulting in greater excavation costs. The soils are typically proofrolled to determine their suitability for the placement of new fill or subgrade support. During the wet season, the surface soils have a higher moisture content and will tend to pump, therefore, hindering the placement of new fill. In addition, the drying time, time period between rain events, and temperature is not conducive to scarify soils, allow to dry, and recompact. At this time, the decision should be made by the owner to try either scarify/dry/compact the in-place soils, which could take time, or undercut and replace with suitable material, which could increase the sitework costs. Based on our experience, the amount of undercut could be an additional 1 to 2 feet (or greater in localized areas), whereas in drier weather, lesser amounts of undercutting may be necessary, if recompaction or stabilization of soils left in place can be achieved.

Some undercut soils are not always "unsuitable" soil and can be moisture conditioned and reused as fill in the deep areas if drying conditions are favorable.

"Dry" Season

During the "dry" season, the surface soils have a lower moisture content and will tend to "bridge" or "crust" softer underlying soils. They will generally allow the placement of new fill, but the crust can break down if repeated passes with heavily loaded equipment is persistent. In addition, new fill from cuts or other sources may need to be moisture conditioned prior to compaction. The soils can dry significantly, requiring the addition of water for proper compaction. Water trucks should be used, as necessary, by the contractor to condition the soils within the required specifications.

Contractor Responsibility

The grading contractors have the option of performing their own evaluation of the site conditions to assess the excavation considerations based on the time of year a project is bid. We strongly suggest that the grading contractors conduct their own exploration and evaluation of the site conditions and material management requirements to cost effectively develop the site.

Typically, due to the movement of heavy equipment and weather conditions, the subgrade becomes disturbed during construction. As a result, fine grained clayey soils tend to lose shear strength and support capability. Therefore, additional effort on the Contractor's part will be required to reduce traffic and limit disturbance of soils. It is essential that the subgrade be restored to a properly compacted condition based on optimum moisture and density requirements. Restoration of the subgrade should be addressed in the project specifications.

5.4 Drainage Considerations

Adequate drainage should be provided at the site to reduce the increase in moisture content of the foundation soils. We recommend that the parking lots, walkways, and the ground surface be sloped away from the structure on all sides. Roof drainage should be collected by gutters and downspouts and transmitted by pipe to the storm water drainage system or discharge a minimum of 5 feet away from the building.

5.5 Fill Placement

Soil Fill Material

Soil fill material should be placed in loose lifts not exceeding 8-inches in thickness with a maximum particle size of 3 inches. The following table summarizes the compacted fill requirements:

Location	Test Method	Compaction Required (minimum)	Moisture Content
Structural Areas and 10' beyond perimeter	ASTM D698 (standard)	98 %	-/+3 percentage points of optimum moisture
Parking and Drive Areas and 5' beyond the curb	ASTM D698 (standard)	98 %	-/+3 percentage points of optimum moisture

Structural fill material should meet the following characteristics:

Property	Requirement
Organic Material	≤ 5%
Liquid Limit	‹ 50%
Plasticity Index	≤ 25%
Maximum Dry Density	≥ 100 lb/ft^3
Maximum Particle Size	3 inches or less

Samples of the proposed fill materials, either from on-site or borrow, should be provided to the geotechnical engineer for Proctor testing and evaluation prior to placement. The on-site soils (classified as SC and CL) should be suitable for reuse as structural fill material but may need to be moisture conditioned. Density tests should be performed to document compaction and moisture content of any earthwork involving soils and other applicable materials. Density tests should be performed frequently, with a recommended minimum of one test per 5,000 square feet per lift of fill in structural areas and one test per 10,000 square feet per lift in other areas. Fill material must meet the specified density and moisture requirements to be considered acceptable.

5.6 Backfilling of Utility Trenches

Backfilling of storm drain and utility trenches must be performed in a controlled manner to reduce settlement of the fill and cracking of overlying floor slabs and pavements. We recommend that utility trenches be backfilled with acceptable borrow or dense-graded crushed stone in 6-inch loose lifts compacted with mechanical piston tampers to the project requirements. Should seepage occur in utility trenches, it may be necessary to "floor" the trench with dense-graded gravel to provide a working surface. If crushed stone is used to backfill utility trenches, we recommend that dense graded aggregate (DGA, compacted in lifts) be used. Open-graded crushed stone, such as ALDOT #57, can serve as a channel for seepage toward structures and therefore is not recommended for use as utility trench backfill within 5 feet of the building's exterior perimeter and under pavements and drives.

5.7 Subgrade Restoration

Typically, due to the movement of heavy equipment and weather conditions, the subgrade soil becomes disturbed during construction. As a result, these soils tend to lose shear strength and support capability. Therefore, additional effort on the contractor's part will be required to reduce traffic and limit disturbance of soils. It is essential that the subgrade be restored to a properly compacted condition based on optimum moisture and density.

6.0 STRUCTURAL RECOMMENDATIONS

6.1 Shallow Foundations

If the site is prepared as above, column and wall foundations can be supported on shallow foundations. We recommend that conventional shallow foundations should be sized for a maximum allowable bearing capacity of 2,000 pounds per square foot (psf). The foundations should bear at a minimum depth of 18 inches below the proposed final exterior grade in the medium to stiff naturally occurring soils or newly placed compacted fill material. Based on the assumed building loads we anticipate post-construction settlements of 1-inch for total and ½-inch for differential settlement over a distance of 50 feet.

Even though computed footing dimensions may be less, column footings and continuous footings should have minimum width dimensions of 24 inches and 18 inches, respectively. This allows for hand cleaning of materials disturbed during the excavation process and reduces the potential for punching shear failure.

Foundation concrete should be placed the same day as footings are excavated so that the foundation bearing soils can remain near the existing moisture content. Foundation bearing surfaces should not be disturbed or left exposed during inclement weather. Saturation of the on-site soils can cause a loss of strength and increased compressibility. If bearing soils dry excessively, the can later well and heave foundations. Excavations for footings should be hand cleaned to remove loose soil or mud and the bearing surface should be thoroughly compacted. If concrete placement is not possible immediately after excavation, we recommend that a thin layer (approximately 2 inches) of lean concrete or CLSM be placed on the bearing surface for protection after we have observed and evaluated the exposed bearing surfaces.

All foundation excavations should be observed by the geotechnical engineer or his representative. The engineer can provide geotechnical guidance to the owner's design team should any unforeseen foundation problems develop during construction. If areas of foundation surfaces prove to be unsuitable, the foundation may need to be over-excavated. The over-excavated area can be backfilled with "lean" concrete, controlled low strength material (CLSM), or well-compacted dense graded crushed stone (ALDOT 825B) up to the planned foundation bearing depth.

6.2 Floor Slabs

It is our opinion that floor slabs can be built on-grade achieving support from properly compacted fill material or approved existing subgrade. For select fill subgrade soils compacted to at least 98 percent of the materials standard Proctor maximum dry density, we recommend a modulus of subgrade reaction of 125 psi/in (pci). Ground supported slabs should be founded on a minimum of 4 inches of compacted, granular materials such as crushed stone or a clean sand with less than 10% passing the #200 sieve. This layer should provide uniform and immediate support of the slab and act as a capillary break. A vapor retarder should be used on top of the granular layer, as required by the building use.

Care should be taken so that fines from the subgrade are not allowed to contaminate the granular layer. If fines do contaminate this layer, capillary rise and subsequent damage to moisture sensitive floor coverings could occur. On most projects, there is some time lag between initial grading and the time when the contractor is ready to place concrete for the slab-on-grade. Inclement weather just prior to placement of concrete for the slab-on-grade can result in trapped water in the granular layer.

6.3 Seismic Site Classification

Subsurface information (SPT and soil classification) from the borings, published geologic information, and our experience was used to estimate the seismic site classification according to methods in the 2021 International Building Code. Based upon this information, we recommend a Seismic Class of **D (Stiff Soil)** for this site. The design responses for the short 0.2-sec (S_{DS}) and 1-second period (S_{D1}) are included in the following table. The responses are modeled on the ASCE Hazard Tool (https://ascehazardtool.org) for the site located at approximate Latitude 31.195011 and an approximate Longitude -85.370993. Based on our understanding of the project, we have assumed a Rick Category of **III**. If the Risk Category is different, the values below may need to be revised.

Period (sec)	Mapped Spectral Response Accelerations (g)		Values of Site Coefficient for Site Class		Maximum Spectral Response Acceleration Adjusted for Site Class (g)		Design Spectral Response Acceleration (g)	
0.2	S_S	0.082	F_a	1.6	S_{MS}	0.132	S_{DS}	0.088
1.0	S_1	0.058	F_v	2.4	S_{M1}	0.139	S_{D1}	0.093

Reference: ASCE Hazard Tool (https://ascehazardtool.org)

7.0 PAVEMENTS

7.1 General

We have not been provided with traffic information at the time of this report; however, based on similar projects of this type, we assume that typical traffic will include passenger vehicles and occasional delivery and garbage trucks. If this traffic information changes, it should be provided to us for review and, if necessary, to make changes to pavement recommendations and sections herein.

Based on the existing site conditions and planned use, we recommend that a flexible pavement be utilized in the parking and drive lanes and a rigid pavement in the area of the dumpster pad and any loading areas.

7.2 Subgrade

The pavement subgrades should be thoroughly proofrolled prior to fine grading to identify loose or soft soils not encountered during the mass grading of the site. Any loose or soft areas should be remediated as outlined in Section 5.0 of this report. **Undercut of loose/soft materials and either recompaction or replacement with structural fill should be budgeted for the 2 feet underlying the pavements per Section 5.2 of this report. If pavement areas require further stabilization, an additional option of geotextile and stone should also be considered and budgeted as well.**

Typically, during construction, the pavement subgrade becomes disturbed because of traffic and environmental conditions. Prior to construction of pavements, it is essential that the subgrade be restored to a properly compacted condition. The specifications should include notes pertaining to subgrade restoration immediately prior to pavement construction. The on-site clayey soils will tend to lose shear strength (and consequently pavement support capability) if they are exposed to excessive moisture. Thus, proper moisture conditioning of the subgrade prior to placement of the pavement base course will result in better pavement performance.

7.3 Rigid Pavement

All Portland cement concrete pavements should contain 4 to 6 percent entrained air assuming the mix will contain ¾ -inch to 1-inch nominal maximum size aggregate. The concrete slump should be no more than 2 inches when placed by slip forming and no more than 4 inches for non-slip formed concrete. Minimum 28-day concrete compressive strength should be 4,000 psi and minimum flexural strength 650 psi.

Pavement Area	Minimum Section Thickness	Pavement Materials
Standard Duty Pavements	5.0 inches	ALDOT Section 450A Concrete Pavement
	4.0 inches (1)	ALDOT Section 825 Type B, Dense Graded Aggregate Base (100% Modified)
Heavy Duty Pavements	6.0 inches	ALDOT Section 424A Superpave Bituminous Wearing Surface
	4.0 inches (1)	ALDOT Section 825 Type B, Dense Graded Aggregate Base (100% Modified)

(1) In lieu of crushed aggregate base course (ALDOT 825 Type B), soil aggregate base course (ALDOT 823 Type B or C) can be utilized with a thickness of 8 inches for Standard Duty and Heavy Duty pavement sections.

Pavement joints, reinforcing, and details should be designed in accordance with the applicable American Concrete Institute (ACI) standards. Portland cement concrete pavement should meet the requirements of ALDOT Section 450.

7.4 Flexible Pavement

The typical minimum flexible pavement sections should include the following:

Pavement Area	Minimum Section Thickness	Pavement Materials
Standard Duty Pavements	1.0 inch	ALDOT Section 424A Superpave Bituminous Wearing Surface
	2.0 inches	ALDOT Section 424B Superpave Bituminous Binder Layer
	6.0 inches (1)	ALDOT Section 825 Type B, Dense Graded Aggregate Base (100% Modified)
Heavy Duty Pavements	1.5 inches	ALDOT Section 424A Superpave Bituminous Wearing Surface
	3.0 inches	ALDOT Section 424B Superpave Bituminous Binder Layer
	6.0 inches (1)	ALDOT Section 825 Type B, Dense Graded Aggregate Base (100% Modified)

(1) In lieu of crushed aggregate base course (ALDOT 825 Type B), soil aggregate base course (ALDOT 823 Type B or C) can be utilized with a thickness of 9 inches for Standard Duty and Heavy Duty pavement sections.

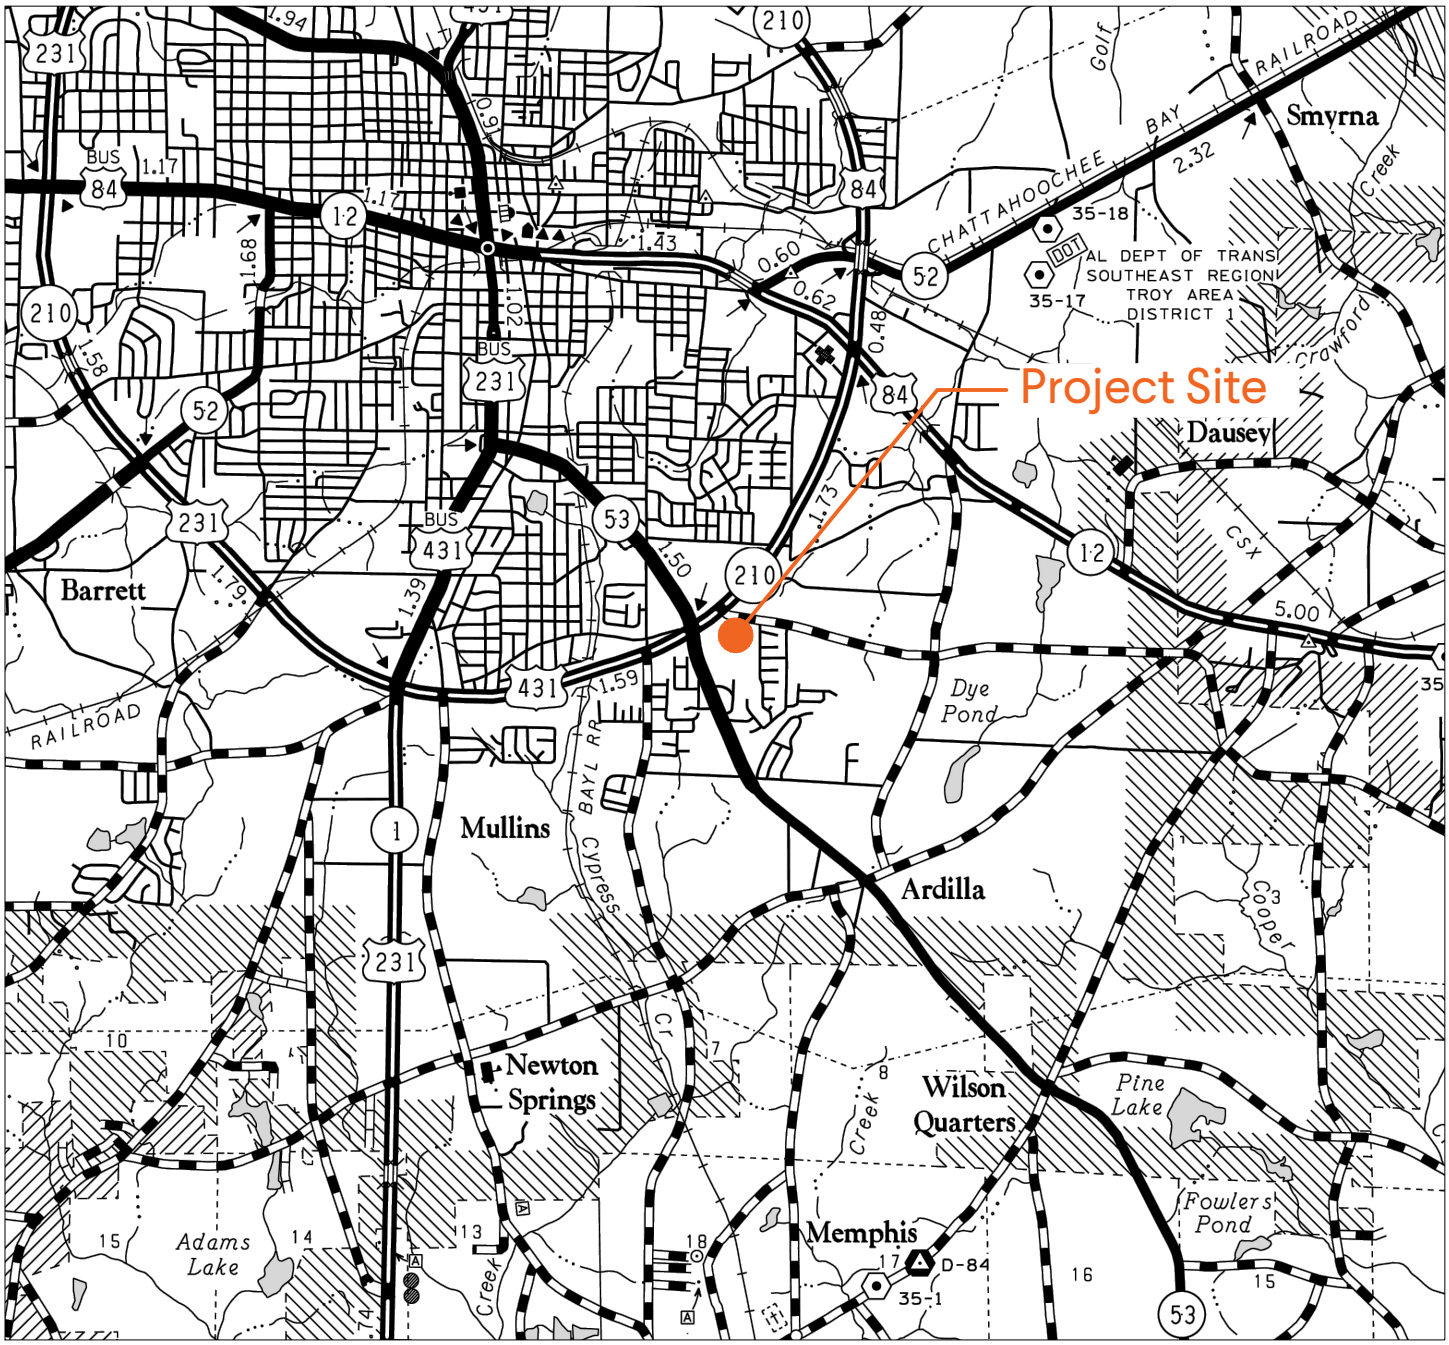
A prime coat (ALDOT Section 401) should be placed on the dense graded aggregate prior to bituminous binder layer placement. A tack coat (ALDOT Section 405) should be placed between bituminous pavement layers. The pavement sections represent the minimum recommended thickness for a pavement section designed for a 20-year life. However, periodic maintenance should be anticipated over the pavement design life. All pavement materials and construction procedures should conform to the *State of Alabama Department of Transportation Standard Specifications for Highway Construction, Latest Edition*. The hot-mix asphalt should conform to Section 424.

8.0 REPORT LIMITATIONS

The recommendations submitted are based on the available soil information obtained by GMC and design details furnished by GMC for the proposed project. Additional borings should be drilled at the site to help characterize the subsurface conditions. In addition, building and loading condition specific geotechnical explorations should be performed for individual building sites so that site-specific recommendations can be provided.

The recommendations submitted are based on the available soil information obtained by GMC and design details furnished by GMC for the proposed project. If there are any revisions to the plans for this project or if deviations from the subsurface conditions noted in this report are encountered during construction, we should be notified immediately to determine if changes in the foundation, or other, recommendations are required. If GMC is not retained to perform these functions, GMC cannot be responsible for the impact of those conditions on the performance of the project.

The findings, recommendations, specifications, or professional advice contained herein have been made in accordance with generally accepted professional geotechnical engineering practices in the local area. No other warranties are implied or expressed.



After the plans and specifications are more complete, the geotechnical engineer should be provided the opportunity to review the final design plans and specifications to check that our engineering recommendations have been properly incorporated into the design documents. At that time, it may be necessary to submit supplementary recommendations.

We emphasize that this report was prepared for design and informational purposes only and may not be sufficient to prepare an accurate construction budget. Contractors reviewing this report should acknowledge that the recommendations contained herein are for design and informational purposes only. In no case should this report be utilized as a substitute for the development of specific earthwork specifications.

The information contained in this report is not intended, nor is sufficient, to aid in the design of segmental or mechanically stabilized earth (MSE) retaining walls. Segmental or MSE wall designers and builders should not rely on this report and should perform independent analysis to determine all necessary soil characteristics for use in their wall design, including but not limited to, soil shear strengths, bearing capacities, global stability, etc.

GMC

FIELD TEST PROCEDURES

General

The general field procedures employed by Goodwyn Mills Cawood, LLC (GMC), are summarized in the American Society for Testing and Materials (ASTM) Standard D420 which is entitled "Investigating and Sampling Soil and Rock". This recommended practice lists recognized methods for determining soil and rock distribution and groundwater conditions. These methods include geophysical and in-situ methods as well as borings.

The detailed collection methods used during this exploration are presented in the following paragraphs.

Standard Drilling Techniques

General: To obtain subsurface samples, borings are drilled using one of several alternate techniques depending upon the subsurface conditions. These techniques are as follows:

In Soils:

a) Continuous hollow stem augers.
b) Rotary borings using roller cone bits or drag bits, and water or drilling mud to flush the hole.
c) "Hand" augers.

In Rock:

a) Core drilling with diamond-faced, double or triple tube core barrels.
b) Core boring with roller cone bits.

Hollow Stem Auger: A hollow stem augers consists of a hollow steel tube with a continuous exterior spiral flange termed a flight. The auger is turned into the ground, returning the cuttings along the flights. The hollow center permits a variety of sampling and testing tools to be used without removing the auger.

Rotary Borings: Rotary drilling involves the use of roller cone or drag type drill bits attached to the end of drill rods. A flushing medium, normally water or bentonite slurry, is pumped through the rods to clear the cuttings from the bit face and flush them to the surface. Casing is sometimes set behind the advancing bit to prevent the hole from collapsing and to restrict the penetration of the drilling fluid into the surrounding soils. Cuttings returned to the surface by the drilling fluid are typically collected in a settling tank, to allow the fluid to be recirculated.

Hand Auger Boring: Hand auger borings are advanced by manually twisting a 4" diameter steel bucket auger into the ground and withdrawing it when filled to observe the sample collected. Posthole diggers are sometimes used in lieu of augers to obtain shallow soil samples. Occasionally these hand auger borings are used for driving 3-inch diameter steel tubes to obtain intact soil samples.

Dual-Mass Dynamic Cone Penetrometer: Dual-Mass Dynamic Cone Penetrometer tests (DM-DCP) test is intended to provide data that can be correlated to an in situ California Bearing Ratio test. A 0.79-inch O.D. cone is seated at the test location and driven with a 17.6-pound (or 10.1-pound) weight falling 22.6 inches. The length of penetration is recorded with a given number of blows. The values are then evaluated and correlated with an in situ CBR.

Dynamic Cone Penetrometer: Dynamic Cone Penetrometer tests (DCP) is intended to provide data that can be correlated to the standard penetration test (SPT). A 1.5 inch O.D. cone is seated to penetrate any loose cuttings, then driven three, 1-3/4" increments with blows from a 15-pound weight falling 20 inches. The average number of blows required to drive the cone three increments is an index to soil strength and compressibility.

Core Drilling: Soil drilling methods are not normally capable of penetrating through hard cemeted soil, weathered rock, coarse gravel or boulders, thin rock seams, or the upper surface of sound, continuous rock. Material that cannot be penetrated by auger or rotary soil-drilling methods at a reasonable rate is designated as “refusal material”. Core drilling procedures are required to penetrate and sample refusal materials.

Prior to coring, casing may be set in the drilled hole through the overburden soils, to keep the hole from caving and to prevent excessive water loss. The refusal materials are then cored according to ASTM D2113 using a diamond studded bit fastened to the end of a hollow, double or triple tube core barrel. This device is rotated at high speeds, and the cuttings are brought to the surface by circulating water. Core samples of the material penetrated are protected and retained in the swivel-mounted inner tube. Upon completion of each drill run, the core barrel is brought to the surface, the core recovery is measured, and the core is placed, in sequence, in boxes for storage and transported to our laboratory.

Sampling and Testing in Boreholes

General: Several techniques are used to obtain samples and data in soils; however, the most common methods in this area are:

a) Standard Penetrating Testing
b) Water Level Readings

These procedures are presented below. Any additional testing techniques employed during this exploration are contained in other sections of the Appendix.

Standard Penetration Testing: At regular intervals, the drilling tools are removed and soil samples obtained with a standard 2-inch diameter split tube sampler connected to an A or N-size rod. The sampler is first seated 6 inches to penetrate any loose cuttings, and then driven an additional 12 inches with blows of a 140-pound safety hammer falling 30 inches. Generally, the number of hammer blows required to drive the sampler the final 12 inches is designated the "penetration resistance" or "N" value, in blows per foot (bpf). The split barrel sampler is designed to retain the soil penetrated, so that it may be returned to the surface for observation. Representative portions of the soil samples obtained from each split barrel sample are placed in jars, sealed and transported to our laboratory.

The standard penetration test, when properly evaluated, provides an indication of the soil strength and compressibility. The tests are conducted according to ASTM Standard D1586. The depths and N-values of standard penetration tests are shown on the Boring Records. Split barrel samples are suitable for visual observation and classification tests but are not sufficiently intact for quantitative laboratory testing.

Water Level Readings: Water table readings are normally taken in the borings and are recorded on the Boring Records. In sandy soils, these readings indicate the approximate location of the hydrostatic water table at the time of our field exploration. In clayey soils, the rate of water seepage into the borings is low and it is generally not possible to establish the location of the hydrostatic water table through short-term water level readings. Also, fluctuation in the water table should be expected with variations in precipitation, surface run-off, evaporation, and other factors. For long-term monitoring of water levels, it is necessary to install piezometers. The water levels reported on the Boring Records are determined by field crews immediately after the drilling tools are removed, and several hours after the borings are completed, if possible. The time lag is intended to permit stabilization of the groundwater table, which may have been disrupted by the drilling operation.

Occasionally the borings will cave-in, preventing water level readings from being obtained or trapping drilling water above the cave-in zone. The cave-in depth is measured and recorded on the Boring Records.

Boring Records

The subsurface conditions encountered during drilling are reported on a field boring record prepared by the Driller. The record contains information concerning the boring method, samples attempted and recovered, indications of the presence of coarse gravel, cobbles, etc., and observations of ground water. It also contains the driller's interpretation of the soil conditions between samples. Therefore, these boring records contain both factual and interpretive information. The field boring records are kept on file in our office.

After the drilling is completed, a geotechnical professional classifies the soil samples and prepares the final Boring Records, which are the basis for all evaluations and recommendations. The following terms are taken from ASTM D2487 or Deere's Technical Description of Rock Cores for Engineering Purposes, Rock Mechanical Engineering Geology 1, pp. 18-22.

Relative Density of Cohesionless Soils From Standard Penetration Test	
Very Loose	‹ 4 bpf
Loose	5 - 10 bpf
Medium	11 – 30 bpf
Dense	31 - 50 bpf
Very Dense	› 50 bpf
(bpf = blows per foot, ASTM D 1586)	

Consistency of Cohesive Soils	
Very Soft	‹ 2 bpf
Soft	3 - 4 bpf
Medium	5 - 8 bpf
Stiff	9 - 15 bpf
Very Stiff	16 - 30 bpf
Hard	› 30 bpf

Relative Hardness of Rock
Very Soft Rock disintegrates or easily compresses to touch; can be hard to very hard soil.
Soft Rock may be broken with fingers.
Moderately Soft Rock may be scratched with a nail, corners and edges may be broken with fingers.
Moderately Hard Rock a light blow of hammer is required to break samples.
Hard Rock a hard blow of hammer is required to break sample.

Particle Size Identification	
Boulders	Larger than 12"
Cobbles	3" - 12"
Gravel	
Coarse	3/4" - 3"
Fine	4.76mm - 3/4"
Sand	
Coarse	2.0 - 4.76 mm
Medium	0.42 - 2.00 mm
Fine	0.42 - 0.074 mm
Fines (Silt or Clay)	Smaller than 0.074 mm

Rock Continuity

RECOVERY = $\frac{\text{Total Length of Core}}{\text{Length of Core Run}}$ x 100 %

Description	Core Recovery %
Incompetent	Less than 40
Competent	40 - 70
Fairly Continuous	71 - 90
Continuous	91 - 100

Relative Quality of Rocks

RQD = $\frac{\text{Total core, counting only pieces › 4" long}}{\text{Length of Core Run}}$ x 100 %

Description	RQD %
Very Poor	0 - 25 %
Poor	25 - 50 %
Fair	50 - 75 %
Good	75 - 90 %
Excellent	90 - 100 %

GMC

LABORATORY TESTING

GENERAL

The laboratory testing procedures employed by Goodwyn Mills Cawood, LLC (GMC) are in general accordance with ASTM standard methods and other applicable specifications. Several test methods, described together with others in this Appendix, were used during the course of this exploration. The Laboratory Data Summary sheet indicates the specific tests performed.

SOIL CLASSIFICATION

Soil classifications provide a general guide to the engineering properties of various soil types and enable the engineer to apply past experience to current problems. In our investigations, samples obtained during drilling operations are examined in our laboratory and visually classified by an engineer. The soils are classified according to consistency (based on number of blows from standard penetration tests), color and texture. These classification descriptions are included on our "Boring Records".

The classification system discussed above is primarily qualitative and for detailed soil classification, two laboratory tests are commonly performed: grain size tests and plasticity tests. Using these test results the soil can be classified according to the AASHTO or Unified Classification Systems (ASTM D2487). Each of these classification systems and the in-place physical soil properties provides an index for estimating the soil's behavior. The soil classification and physical properties obtained are presented in this report.

POCKET PENETROMETER TEST

A pocket penetrometer test is performed by pressing the tip of a small, spring-loaded penetrometer with even pressure to a prescribed depth into a soil sample. This test yields a value for unconfined compressive strength, which may be correlated with unconfined compressive strengths obtained by other laboratory methods.

MOISTURE CONTENT

Moisture contents are determined from representative portions of the specimen. The soil is dried to a constant weight in an oven at 100° C and the loss of moisture during the drying process is measured. From this data, the moisture content is computed.

ATTERBERG LIMITS

Liquid Limit (LL), Plastic Limit (PL) and Shrinkage Limit (SL) tests are performed to aid in the classification of soils and to determine the plasticity and volume change characteristics of the materials. The Liquid Limit is the minimum moisture content at which a soil will flow as a heavy viscous fluid. The Plastic Limit is the minimum moisture content at which the soil behaves as a plastic material. The Shrinkage Limit is the moisture content below which no further volume change will take place with continued drying. The Plasticity Index (PI) is the numeric difference of Liquid Limit and Plastic Limit and indicates the range of moisture content over which a soil remains plastic. These tests are performed in accordance with ASTM D4318, D4943 and D427.

PARTICLE SIZE DISTRIBUTION

The distribution of soils coarser than the No. 200 (75-mm) sieve is determined by passing a representative specimen through a standard set of nested sieves. The weight of material retained on each sieve is determined and the percentage retained (or passing) is calculated.

A specimen may be washed through only the No. 200 sieve, if the full range of particle sizes is not required. The percentage of material passing the No. 200 sieve is reported.

The distribution of materials finer than the No. 200 sieve is determined by use of a hydrometer. The particle sizes and distribution are computed from the time rate of settlement of the different size particles while suspended in water. These tests are performed in accordance with ASTM D421, D422 and D1140.

RE: REPORT OF GEOTECHNICAL EXPLORATION
ALABAMA DEPARTMENT OF HUMAN RESOURCES
DHR – HOUSTON COUNTY
DOTHAN, HOUSTON COUNTY, ALABAMA
GMC PROJECT NO. GMGM250037

Dear Ms. Hart,

Goodwyn Mills Cawood, LLC (Geotechnical & Construction Services Division) is pleased to provide this report of geotechnical exploration performed for the above referenced project. This report includes the results of field and laboratory testing and general recommendations for foundation design and sitework.

We appreciate the opportunity to perform this study during this phase of the project for you and look forward to continued participation during the construction phase of this project. If you have any questions pertaining to this report, or if we may be of further service, please do not hesitate to call.

Sincerely,
GOODWYN MILLS CAWOOD, LLC

Field and Laboratory Procedures

1.0 EXECUTIVE SUMMARY

A geotechnical exploration has been conducted for the proposed Alabama Department of Human Resources (DHR) Office Building to be located on Prevatt Road in Dothan, Houston County, Alabama. The proposed site is currently adjacent (east) to the existing DHR Office Building which is located at the southwest corner of U.S. 431 and Prevatt Road.

We have been provided with a preliminary site outline; however, detailed grading and structural information have not been provided at the time of this report. The site has been previously developed and is relatively level. We understand that the proposed office building will be approximately 45,000 square feet. We anticipate future building and parking grades to be within approximately 5 feet of current site elevations. Likewise, we have assumed maximum column and wall loads of 150 kips and 4 kips/foot, respectively, and construction will be masonry (CMU) type with steel joists.

- A total of seventeen (17) soil test borings were drilled at the site. Six (6) borings were drilled in the proposed building footprint to a depth of 20 feet each. Eleven (11) borings were drilled in the planned parking and drive areas to a depth of 10 feet each.
- The borings initially encountered 4 to 9 inches of organic-laden material (topsoil) across the site.
- The borings predominantly encountered approximately 2 to 3 feet of existing fill material generally classified very loose to medium silty sand (SM). Standard Penetration Test (SPT) N-Values in these materials ranged from 0 to 10 blows per foot (bpf).
- Below the existing fill materials, the borings typically encountered varying layers of very loose to dense clayey sand (SC) and very soft to hard sandy lean clay (CL) to the boring termination depths. The borings generally encountered soils with more clay and higher consistency with increasing depth below the surface. SPT N-Values in these materials ranged from 2 to 35 bpf.
- Groundwater was not encountered at the time of drilling.
- The site should be suitable for development, provided it is prepared herein. The main development issue for this site will be the low consistency soils (SPT N-values ‹ 8 bpf) and existing fill in the upper 4 to 6 feet of the existing subgrade elevation.
- **We recommend an allowance for the removal and replacement of approximately 4 feet of unsuitable materials within the building footprint and 2 feet within the pavement areas be included in the bid documents.** The undercut area should extend ten (10) feet beyond the building and five (5) feet beyond the parking areas.
- An additional option of geotextile and stone should also be considered and budgeted as well, if pavement areas require further stabilization beyond the upper two (2) feet.
- We recommend that conventional shallow foundations should be sized for a maximum allowable bearing capacity of 2,000 pounds per square foot (psf). The foundations should bear at a minimum depth of 18 inches below the proposed final exterior grade in the medium to stiff naturally occurring soils or newly placed compacted fill material.

The following sections provide additional detailed recommendations. The recommendations presented herein have been developed on the basis of the subsurface conditions encountered during field investigation and our understanding of the proposed construction. Should changes in the project criteria occur, a review must be carried out by GMC to determine if modifications to our recommendations will be required.

2.0 PROJECT INFORMATION AND SCOPE OF WORK

2.1 Project Information

A geotechnical exploration has been conducted for the proposed Alabama Department of Human Resources (DHR) Office Building to be located on Prevatt Road in Dothan, Houston County, Alabama. The proposed site is currently adjacent (east) to the existing DHR Office Building which is located at the southwest corner of U.S. 431 and Prevatt Road.

We have been provided with a preliminary site outline; however, detailed grading and structural information have not been provided at the time of this report. The site has been previously developed and is relatively level. We understand that the proposed office building will be approximately 45,000 square feet. We anticipate future building and parking grades to be within approximately 5 feet of current site elevations. Likewise, we have assumed maximum column and wall loads of 150 kips and 4 kips/foot, respectively, and construction will be masonry (CMU) type with steel joists.

2.2 Scope of Work

The purpose of this exploration was to perform a general evaluation of the subsurface soil conditions at the site and to provide general sitework, pavement, and foundation recommendations. The scope of the exploration and evaluation included drilling a total of seventeen (17) soil test borings. Six (6) borings were drilled in the proposed building footprint to a depth of 20 feet each. Eleven (11) borings were drilled in the planned parking areas to a depth of 10 feet each. It also included an engineering evaluation of the materials encountered.

The scope of services for the geotechnical study did not include any environmental assessment for the presence or absence of wetlands or hazardous or toxic materials in the soil, surface water, groundwater, or air, on or below or around this site. Any statements in this report or on the boring records regarding odors, colors, or unusual or suspicious items or conditions are strictly for the information of the client.

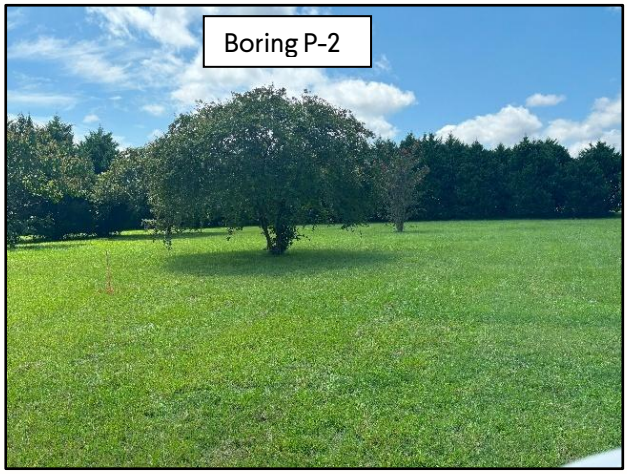
3.0 FIELD EXPLORATION AND LABORATORY TESTING

3.1 Field Exploration

The boring locations and depths were selected by GMC personnel. Field testing employed by GMC was performed in general accordance with ASTM standards or generally accepted methods. The borings were located in the field by GMC personnel.

The borings were performed on August 13, 2025 using a Geoprobe 7822 drill rig equipped with a rotary head and hollow stem augers (HSA). Soils were sampled using a two-inch OD split barrel sampler in accordance with ASTM D1586 driven with an automatic hammer.

3.2 Laboratory Testing



The laboratory testing program included visual classification of all soil samples and laboratory tests consisting of natural moisture contents, grain size analyses, and Atterberg limits tests. The laboratory testing program was conducted in accordance with applicable ASTM Standards, and the results are indicated on the Boring Records and summarized in the Appendix.

4.0 SITE AND SUBSURFACE CONDITIONS

4.1 General

At the time of this study, the proposed site was located on the south side of Prevatt Road approximately 700 feet east of its intersection with U.S. 431. The site currently includes a residential house with typical landscaping as well as other landscaped areas including short grasses and trees/bushes. The site slopes gently downward from the northwest corner to the southeast corner. Current topographic maps indicate site elevations range from EL 332 feet (SE Corner) to EL 345 feet (NW Corner). The photos below show the site at the time of our investigation.

4.2 Site Geology

Published geologic information indicates that the site is underlain by Residuum consisting of the Claiborne/Jackson Group of the Eocene-Oligocene Age. The primary constituency of this formation is clay or mud, with others consisting of sand, limestone, and chert. White to moderate-reddish-orange locally mottled sandy clay and residual clay with scattered layers of gravelly medium to coarse sand, fossiliferous chert and limestone boulders and limonitic sand masses are observed.

4.3 Subsurface Conditions

Surficial Materials
The borings initially encountered 4 to 9 inches of organic laden material (topsoil) across the site.

Existing Fill Materials
The borings predominantly encountered approximately 2 to 3 feet of existing fill material generally classified very loose to medium silty sand (SM). Standard Penetration Test (SPT) N-Values in these materials ranged from 0 to 10 blows per foot (bpf). It is likely that this material was placed during the original construction and grading of the existing residential house lot.

Residual Materials
Below the existing fill materials, the borings typically encountered varying layers of very loose to dense clayey sand (SC) and very soft to hard sandy lean clay (CL) to the boring termination depths. The borings generally

encountered soils with more clay and higher consistency with increasing depth below the surface. SPT N-Values in these materials ranged from 2 to 35 bpf. Auger refusal was not encountered in the borings.

The subsurface descriptions contained herein are of a generalized nature to highlight the major soil stratification features and soil characteristics. The boring records included in the Appendix should be reviewed for specific information as to individual boring location. The stratification shown on the boring records represents conditions only at the actual boring location. Variations may occur and should be expected across the site. The stratifications represent the approximate boundary between subsurface materials, and the transition may be gradual.

4.4 Groundwater Information

Groundwater was not encountered in the borings at the time of drilling. The borings were backfilled prior to leaving the site for safety reasons and therefore no long-term groundwater levels were recorded. It is important to note that the groundwater levels may not have stabilized in the borings. Furthermore, groundwater levels may vary due to seasonal conditions and recent rainfall.

5.0 SITEWORK RECOMMENDATIONS

5.1 General

The site should be suitable for development, provided it is prepared herein. The main development issue for this site will be the low consistency soils (SPT N-values ‹ 8 bpf) and existing fill in the upper 4 to 6 feet of the site. These soils should be remediated by removal and either replacement or recompaction to provide a suitable subgrade for foundations, slab support, and pavements.

5.2 Sitework Recommendations

Clearing and Stripping

Sitework should begin with clearing and grubbing of the site and should include the removal of the organic laden material, deleterious material, and asphalt pavement. All existing underground utilities and foundations to be abandoned in the planned construction areas should be removed and properly backfilled with structural fill material. We recommend a minimum of 10-inches of stripping be budgeted for this site.

Low Consistency Soils

The borings encountered existing fill materials and residual soils consisting of very loose to loose clayey and silty sands (SC and SM) and very soft to soft sandy lean clay (CL) in the upper 4 to 6 feet of the site. These soils, if left in place, could result in settlement of foundations and pavements above generally acceptable tolerable limits.

If foundations or pavements are to be located in these materials, we recommend these soils be evaluated and remediated to provide a stable bearing surface. Loose or soft soils may be moisture conditioned and compacted per Section 5.5 of this report or undercut to suitable material. All subgrade soils should be evaluated by a geotechnical engineer or his representative to determine suitability prior to fill placement or building construction. **We recommend an allowance for the removal and replacement of approximately 4 feet of unsuitable materials within the building footprint and 2 feet within the pavement areas be included in the bid documents.** The undercut area should extend ten (10) feet in the building and five (5) feet beyond the parking

areas. Prior to undercutting, the site should be stripped and cut to the subgrade elevation, compacted, and proofrolled as noted below.

Undercut soils may be stockpiled and re-used as structural fill material, if they are free of deleterious materials and meet the specifications of Section 5.5 of this report. We anticipate that these soils will require moisture conditioning to be able to be reused. Additional testing of these soils would be required.

Proofrolling

Once the site is at grade and prior to the placement of any new fill, the areas should be proofrolled with repeated passes of a loaded tandem axle dump truck to locate deeper soft soils. Soils that are observed to rut or deflect excessively under the moving load should be undercut and replaced with properly compacted fill. The proofrolling, undercutting, and filling activities should be witnessed by a qualified representative of the geotechnical engineer and should be performed during a period of dry weather.

We anticipate that recompaction of the surface soils will be required. Attempts can first be made to compact the problem soils. If dry weather conditions exist prior to and at the time of construction, re-compaction and densification may prove successful. The soils should be scarified and the soil moisture should be adjusted to within 3 percent of optimum moisture for low plasticity soils. Once proof rolling has been accomplished, then re-compaction of the soils may be attempted. In pavement areas where unsuitable soils are encountered, stabilization using geotextile or geogrid with stone may be a more economical option than removal and replacement of the soils.

5.3 Time of Year Site Preparation Considerations

The time of the year that the sitework begins can affect the project considerably. In this area, the "wet" season is generally between the months of November to April, and the "dry" season from May to October. There are many considerations that need to be addressed prior to bidding a project that could affect the budget based on the time of year a project starts earthwork activities. The time of the year that the geotechnical borings were performed can provide a false sense of actual near surface conditions depending on the time of year and weather conditions. Below are considerations that should be addressed based on the time of the year earthwork is started.

"Wet" Season

During the "wet" season, the amount of undercutting may be greater, therefore resulting in greater excavation costs. The soils are typically proofrolled to determine their suitability for the placement of new fill or subgrade support. During the wet season, the surface soils have a higher moisture content and will tend to pump, therefore, hindering the placement of new fill. In addition, the drying time, time period between rain events, and temperature is not conducive to scarify soils, allow to dry, and recompact. At this time, the decision should be made by the owner to try either scarify/dry/compact the in-place soils, which could take time, or undercut and replace with suitable material, which could increase the sitework costs. Based on our experience, the amount of undercut could be an additional 1 to 2 feet (or greater in localized areas), whereas in drier weather, lesser amounts of undercutting may be necessary, if recompaction or stabilization of soils left in place can be achieved.

Some undercut soils are not always "unsuitable" soil and can be moisture conditioned and reused as fill in the deep areas if drying conditions are favorable.

"Dry" Season

During the "dry" season, the surface soils have a lower moisture content and will tend to "bridge" or "crust" softer underlying soils. They will generally allow the placement of new fill, but the crust can break down if repeated passes with heavily loaded equipment is persistent. In addition, new fill from cuts or other sources may need to be moisture conditioned prior to compaction. The soils can dry significantly, requiring the addition of water for proper compaction. Water trucks should be used, as necessary, by the contractor to condition the soils within the required specifications.

Contractor Responsibility

The grading contractors have the option of performing their own evaluation of the site conditions to assess the excavation considerations based on the time of year a project is bid. We strongly suggest that the grading contractors conduct their own exploration and evaluation of the site conditions and material management requirements to cost effectively develop the site.

Typically, due to the movement of heavy equipment and weather conditions, the subgrade becomes disturbed during construction. As a result, fine grained clayey soils tend to lose shear strength and support capability. Therefore, additional effort on the Contractor's part will be required to reduce traffic and limit disturbance of soils. It is essential that the subgrade be restored to a properly compacted condition based on optimum moisture and density requirements. Restoration of the subgrade should be addressed in the project specifications.

5.4 Drainage Considerations

Adequate drainage should be provided at the site to reduce the increase in moisture content of the foundation soils. We recommend that the parking lots, walkways, and the ground surface be sloped away from the structure on all sides. Roof drainage should be collected by gutters and downspouts and transmitted by pipe to the storm water drainage system or discharge a minimum of 5 feet away from the building.

5.5 Fill Placement

Soil Fill Material

Soil fill material should be placed in loose lifts not exceeding 8-inches in thickness with a maximum particle size of 3 inches. The following table summarizes the compacted fill requirements:

Location	Test Method	Compaction Required (minimum)	Moisture Content
Structural Areas and 10' beyond perimeter	ASTM D698 (standard)	98 %	-/+3 percentage points of optimum moisture
Parking and Drive Areas and 5' beyond the curb	ASTM D698 (standard)	98 %	-/+3 percentage points of optimum moisture

Structural fill material should meet the following characteristics:

Property	Requirement
Organic Material	≤ 5%
Liquid Limit	‹ 50%
Plasticity Index	≤ 25%
Maximum Dry Density	≥ 100 lb/ft^3
Maximum Particle Size	3 inches or less

Samples of the proposed fill materials, either from on-site or borrow, should be provided to the geotechnical engineer for Proctor testing and evaluation prior to placement. The on-site soils (classified as SC and CL) should be suitable for reuse as structural fill material but may need to be moisture conditioned. Density tests should be performed to document compaction and moisture content of any earthwork involving soils and other applicable materials. Density tests should be performed frequently, with a recommended minimum of one test per 5,000 square feet per lift of fill in structural areas and one test per 10,000 square feet per lift in other areas. Fill material must meet the specified density and moisture requirements to be considered acceptable.

5.6 Backfilling of Utility Trenches

Backfilling of storm drain and utility trenches must be performed in a controlled manner to reduce settlement of the fill and cracking of overlying floor slabs and pavements. We recommend that utility trenches be backfilled with acceptable borrow or dense-graded crushed stone in 6-inch loose lifts compacted with mechanical piston tampers to the project requirements. Should seepage occur in utility trenches, it may be necessary to "floor" the trench with dense-graded gravel to provide a working surface. If crushed stone is used to backfill utility trenches, we recommend that dense graded aggregate (DGA, compacted in lifts) be used. Open-graded crushed stone, such as ALDOT #57, can serve as a channel for seepage toward structures and therefore is not recommended for use as utility trench backfill within 5 feet of the building's exterior perimeter and under pavements and drives.

5.7 Subgrade Restoration

Typically, due to the movement of heavy equipment and weather conditions, the subgrade soil becomes disturbed during construction. As a result, these soils tend to lose shear strength and support capability. Therefore, additional effort on the contractor's part will be required to reduce traffic and limit disturbance of soils. It is essential that the subgrade be restored to a properly compacted condition based on optimum moisture and density.

6.0 STRUCTURAL RECOMMENDATIONS

6.1 Shallow Foundations

If the site is prepared as above, column and wall foundations can be supported on shallow foundations. We recommend that conventional shallow foundations should be sized for a maximum allowable bearing capacity of 2,000 pounds per square foot (psf). The foundations should bear at a minimum depth of 18 inches below the proposed final exterior grade in the medium to stiff naturally occurring soils or newly placed compacted fill material. Based on the assumed building loads we anticipate post-construction settlements of 1-inch for total and ½-inch for differential settlement over a distance of 50 feet.

Even though computed footing dimensions may be less, column footings and continuous footings should have minimum width dimensions of 24 inches and 18 inches, respectively. This allows for hand cleaning of materials disturbed during the excavation process and reduces the potential for punching shear failure.

Foundation concrete should be placed the same day as footings are excavated so that the foundation bearing soils can remain near the existing moisture content. Foundation bearing surfaces should not be disturbed or left exposed during inclement weather. Saturation of the on-site soils can cause a loss of strength and increased compressibility. If bearing soils dry excessively, the can later well and heave foundations. Excavations for footings should be hand cleaned to remove loose soil or mud and the bearing surface should be thoroughly compacted. If concrete placement is not possible immediately after excavation, we recommend that a thin layer (approximately 2 inches) of lean concrete or CLSM be placed on the bearing surface for protection after we have observed and evaluated the exposed bearing surfaces.

All foundation excavations should be observed by the geotechnical engineer or his representative. The engineer can provide geotechnical guidance to the owner's design team should any unforeseen foundation problems develop during construction. If areas of foundation surfaces prove to be unsuitable, the foundation may need to be over-excavated. The over-excavated area can be backfilled with "lean" concrete, controlled low strength material (CLSM), or well-compacted dense graded crushed stone (ALDOT 825B) up to the planned foundation bearing depth.

6.2 Floor Slabs

It is our opinion that floor slabs can be built on-grade achieving support from properly compacted fill material or approved existing subgrade. For select fill subgrade soils compacted to at least 98 percent of the materials standard Proctor maximum dry density, we recommend a modulus of subgrade reaction of 125 psi/in (pci). Ground supported slabs should be founded on a minimum of 4 inches of compacted, granular materials such as crushed stone or a clean sand with less than 10% passing the #200 sieve. This layer should provide uniform and immediate support of the slab and act as a capillary break. A vapor retarder should be used on top of the granular layer, as required by the building use.

Care should be taken so that fines from the subgrade are not allowed to contaminate the granular layer. If fines do contaminate this layer, capillary rise and subsequent damage to moisture sensitive floor coverings could occur. On most projects, there is some time lag between initial grading and the time when the contractor is ready to place concrete for the slab-on-grade. Inclement weather just prior to placement of concrete for the slab-on-grade can result in trapped water in the granular layer.

6.3 Seismic Site Classification

Subsurface information (SPT and soil classification) from the borings, published geologic information, and our experience was used to estimate the seismic site classification according to methods in the 2021 International Building Code. Based upon this information, we recommend a Seismic Class of **D (Stiff Soil)** for this site. The design responses for the short 0.2-sec (S_{DS}) and 1-second period (S_{D1}) are included in the following table. The responses are modeled on the ASCE Hazard Tool (https://ascehazardtool.org) for the site located at approximate Latitude 31.195011 and an approximate Longitude -85.370993. Based on our understanding of the project, we have assumed a Rick Category of **III**. If the Risk Category is different, the values below may need to be revised.

Period (sec)	Mapped Spectral Response Accelerations (g)		Values of Site Coefficient for Site Class		Maximum Spectral Response Acceleration Adjusted for Site Class (g)		Design Spectral Response Acceleration (g)	
0.2	S_S	0.082	F_a	1.6	S_{MS}	0.132	S_{DS}	0.088
1.0	S_1	0.058	F_v	2.4	S_{M1}	0.139	S_{D1}	0.093

Reference: ASCE Hazard Tool (https://ascehazardtool.org)

7.0 PAVEMENTS

7.1 General

We have not been provided with traffic information at the time of this report; however, based on similar projects of this type, we assume that typical traffic will include passenger vehicles and occasional delivery and garbage trucks. If this traffic information changes, it should be provided to us for review and, if necessary, to make changes to pavement recommendations and sections herein.

Based on the existing site conditions and planned use, we recommend that a flexible pavement be utilized in the parking and drive lanes and a rigid pavement in the area of the dumpster pad and any loading areas.

7.2 Subgrade

The pavement subgrades should be thoroughly proofrolled prior to fine grading to identify loose or soft soils not encountered during the mass grading of the site. Any loose or soft areas should be remediated as outlined in Section 5.0 of this report. **Undercut of loose/soft materials and either recompaction or replacement with structural fill should be budgeted for the 2 feet underlying the pavements per Section 5.2 of this report. If pavement areas require further stabilization, an additional option of geotextile and stone should also be considered and budgeted as well.**

Typically, during construction, the pavement subgrade becomes disturbed because of traffic and environmental conditions. Prior to construction of pavements, it is essential that the subgrade be restored to a properly compacted condition. The specifications should include notes pertaining to subgrade restoration immediately prior to pavement construction. The on-site clayey soils will tend to lose shear strength (and consequently pavement support capability) if they are exposed to excessive moisture. Thus, proper moisture conditioning of the subgrade prior to placement of the pavement base course will result in better pavement performance.

7.3 Rigid Pavement

All Portland cement concrete pavements should contain 4 to 6 percent entrained air assuming the mix will contain ¾ -inch to 1-inch nominal maximum size aggregate. The concrete slump should be no more than 2 inches when placed by slip forming and no more than 4 inches for non-slip formed concrete. Minimum 28-day concrete compressive strength should be 4,000 psi and minimum flexural strength 650 psi.

Pavement Area	Minimum Section Thickness	Pavement Materials
Standard Duty Pavements	5.0 inches	ALDOT Section 450A Concrete Pavement
	4.0 inches (1)	ALDOT Section 825 Type B, Dense Graded Aggregate Base (100% Modified)
Heavy Duty Pavements	6.0 inches	ALDOT Section 424A Superpave Bituminous Wearing Surface
	4.0 inches (1)	ALDOT Section 825 Type B, Dense Graded Aggregate Base (100% Modified)

(1) In lieu of crushed aggregate base course (ALDOT 825 Type B), soil aggregate base course (ALDOT 823 Type B or C) can be utilized with a thickness of 8 inches for Standard Duty and Heavy Duty pavement sections.

Pavement joints, reinforcing, and details should be designed in accordance with the applicable American Concrete Institute (ACI) standards. Portland cement concrete pavement should meet the requirements of ALDOT Section 450.

7.4 Flexible Pavement

The typical minimum flexible pavement sections should include the following:

Pavement Area	Minimum Section Thickness	Pavement Materials
Standard Duty Pavements	1.0 inch	ALDOT Section 424A Superpave Bituminous Wearing Surface
	2.0 inches	ALDOT Section 424B Superpave Bituminous Binder Layer
	6.0 inches (1)	ALDOT Section 825 Type B, Dense Graded Aggregate Base (100% Modified)
Heavy Duty Pavements	1.5 inches	ALDOT Section 424A Superpave Bituminous Wearing Surface
	3.0 inches	ALDOT Section 424B Superpave Bituminous Binder Layer
	6.0 inches (1)	ALDOT Section 825 Type B, Dense Graded Aggregate Base (100% Modified)

(1) In lieu of crushed aggregate base course (ALDOT 825 Type B), soil aggregate base course (ALDOT 823 Type B or C) can be utilized with a thickness of 9 inches for Standard Duty and Heavy Duty pavement sections.

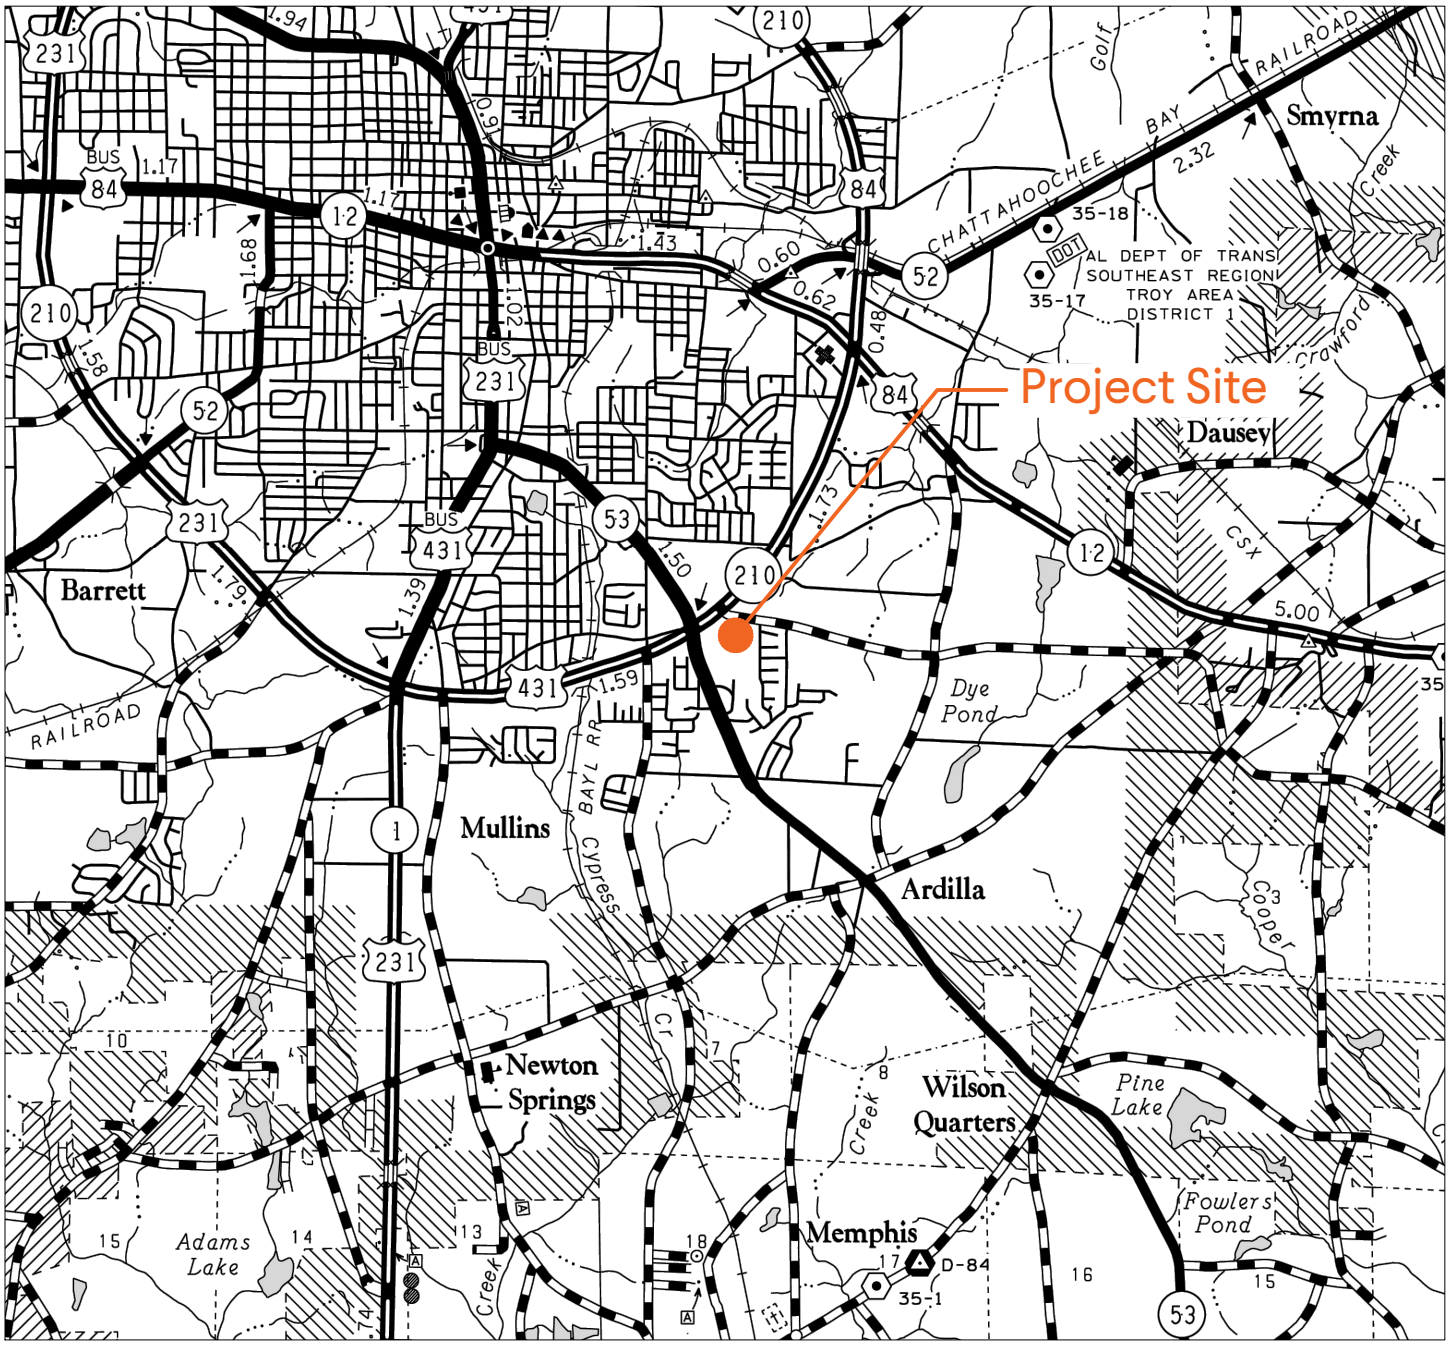
A prime coat (ALDOT Section 401) should be placed on the dense graded aggregate prior to bituminous binder layer placement. A tack coat (ALDOT Section 405) should be placed between bituminous pavement layers. The pavement sections represent the minimum recommended thickness for a pavement section designed for a 20-year life. However, periodic maintenance should be anticipated over the pavement design life. All pavement materials and construction procedures should conform to the *State of Alabama Department of Transportation Standard Specifications for Highway Construction, Latest Edition*. The hot-mix asphalt should conform to Section 424.

8.0 REPORT LIMITATIONS

The recommendations submitted are based on the available soil information obtained by GMC and design details furnished by GMC for the proposed project. Additional borings should be drilled at the site to help characterize the subsurface conditions. In addition, building and loading condition specific geotechnical explorations should be performed for individual building sites so that site-specific recommendations can be provided.

The recommendations submitted are based on the available soil information obtained by GMC and design details furnished by GMC for the proposed project. If there are any revisions to the plans for this project or if deviations from the subsurface conditions noted in this report are encountered during construction, we should be notified immediately to determine if changes in the foundation, or other, recommendations are required. If GMC is not retained to perform these functions, GMC cannot be responsible for the impact of those conditions on the performance of the project.

The findings, recommendations, specifications, or professional advice contained herein have been made in accordance with generally accepted professional geotechnical engineering practices in the local area. No other warranties are implied or expressed.



After the plans and specifications are more complete, the geotechnical engineer should be provided the opportunity to review the final design plans and specifications to check that our engineering recommendations have been properly incorporated into the design documents. At that time, it may be necessary to submit supplementary recommendations.

We emphasize that this report was prepared for design and informational purposes only and may not be sufficient to prepare an accurate construction budget. Contractors reviewing this report should acknowledge that the recommendations contained herein are for design and informational purposes only. In no case should this report be utilized as a substitute for the development of specific earthwork specifications.

The information contained in this report is not intended, nor is sufficient, to aid in the design of segmental or mechanically stabilized earth (MSE) retaining walls. Segmental or MSE wall designers and builders should not rely on this report and should perform independent analysis to determine all necessary soil characteristics for use in their wall design, including but not limited to, soil shear strengths, bearing capacities, global stability, etc.

GMC

FIELD TEST PROCEDURES

General

The general field procedures employed by Goodwyn Mills Cawood, LLC (GMC), are summarized in the American Society for Testing and Materials (ASTM) Standard D420 which is entitled "Investigating and Sampling Soil and Rock". This recommended practice lists recognized methods for determining soil and rock distribution and groundwater conditions. These methods include geophysical and in-situ methods as well as borings.

The detailed collection methods used during this exploration are presented in the following paragraphs.

Standard Drilling Techniques

General: To obtain subsurface samples, borings are drilled using one of several alternate techniques depending upon the subsurface conditions. These techniques are as follows:

In Soils:

a) Continuous hollow stem augers.
b) Rotary borings using roller cone bits or drag bits, and water or drilling mud to flush the hole.
c) "Hand" augers.

In Rock:

a) Core drilling with diamond-faced, double or triple tube core barrels.
b) Core boring with roller cone bits.

Hollow Stem Auger: A hollow stem augers consists of a hollow steel tube with a continuous exterior spiral flange termed a flight. The auger is turned into the ground, returning the cuttings along the flights. The hollow center permits a variety of sampling and testing tools to be used without removing the auger.

Rotary Borings: Rotary drilling involves the use of roller cone or drag type drill bits attached to the end of drill rods. A flushing medium, normally water or bentonite slurry, is pumped through the rods to clear the cuttings from the bit face and flush them to the surface. Casing is sometimes set behind the advancing bit to prevent the hole from collapsing and to restrict the penetration of the drilling fluid into the surrounding soils. Cuttings returned to the surface by the drilling fluid are typically collected in a settling tank, to allow the fluid to be recirculated.

Hand Auger Boring: Hand auger borings are advanced by manually twisting a 4" diameter steel bucket auger into the ground and withdrawing it when filled to observe the sample collected. Posthole diggers are sometimes used in lieu of augers to obtain shallow soil samples. Occasionally these hand auger borings are used for driving 3-inch diameter steel tubes to obtain intact soil samples.

Dual-Mass Dynamic Cone Penetrometer: Dual-Mass Dynamic Cone Penetrometer tests (DM-DCP) test is intended to provide data that can be correlated to an in situ California Bearing Ratio test. A 0.79-inch O.D. cone is seated at the test location and driven with a 17.6-pound (or 10.1-pound) weight falling 22.6 inches. The length of penetration is recorded with a given number of blows. The values are then evaluated and correlated with an in situ CBR.

Dynamic Cone Penetrometer: Dynamic Cone Penetrometer tests (DCP) is intended to provide data that can be correlated to the standard penetration test (SPT). A 1.5 inch O.D. cone is seated to penetrate any loose cuttings, then driven three, 1-3/4" increments with blows from a 15-pound weight falling 20 inches. The average number of blows required to drive the cone three increments is an index to soil strength and compressibility.

Core Drilling: Soil drilling methods are not normally capable of penetrating through hard cemeted soil, weathered rock, coarse gravel or boulders, thin rock seams, or the upper surface of sound, continuous rock. Material that cannot be penetrated by auger or rotary soil-drilling methods at a reasonable rate is designated as “refusal material”. Core drilling procedures are required to penetrate and sample refusal materials.

Prior to coring, casing may be set in the drilled hole through the overburden soils, to keep the hole from caving and to prevent excessive water loss. The refusal materials are then cored according to ASTM D2113 using a diamond studded bit fastened to the end of a hollow, double or triple tube core barrel. This device is rotated at high speeds, and the cuttings are brought to the surface by circulating water. Core samples of the material penetrated are protected and retained in the swivel-mounted inner tube. Upon completion of each drill run, the core barrel is brought to the surface, the core recovery is measured, and the core is placed, in sequence, in boxes for storage and transported to our laboratory.

Sampling and Testing in Boreholes

General: Several techniques are used to obtain samples and data in soils; however, the most common methods in this area are:

a) Standard Penetrating Testing
b) Water Level Readings

These procedures are presented below. Any additional testing techniques employed during this exploration are contained in other sections of the Appendix.

Standard Penetration Testing: At regular intervals, the drilling tools are removed and soil samples obtained with a standard 2-inch diameter split tube sampler connected to an A or N-size rod. The sampler is first seated 6 inches to penetrate any loose cuttings, and then driven an additional 12 inches with blows of a 140-pound safety hammer falling 30 inches. Generally, the number of hammer blows required to drive the sampler the final 12 inches is designated the "penetration resistance" or "N" value, in blows per foot (bpf). The split barrel sampler is designed to retain the soil penetrated, so that it may be returned to the surface for observation. Representative portions of the soil samples obtained from each split barrel sample are placed in jars, sealed and transported to our laboratory.

The standard penetration test, when properly evaluated, provides an indication of the soil strength and compressibility. The tests are conducted according to ASTM Standard D1586. The depths and N-values of standard penetration tests are shown on the Boring Records. Split barrel samples are suitable for visual observation and classification tests but are not sufficiently intact for quantitative laboratory testing.

Water Level Readings: Water table readings are normally taken in the borings and are recorded on the Boring Records. In sandy soils, these readings indicate the approximate location of the hydrostatic water table at the time of our field exploration. In clayey soils, the rate of water seepage into the borings is low and it is generally not possible to establish the location of the hydrostatic water table through short-term water level readings. Also, fluctuation in the water table should be expected with variations in precipitation, surface run-off, evaporation, and other factors. For long-term monitoring of water levels, it is necessary to install piezometers. The water levels reported on the Boring Records are determined by field crews immediately after the drilling tools are removed, and several hours after the borings are completed, if possible. The time lag is intended to permit stabilization of the groundwater table, which may have been disrupted by the drilling operation.

Occasionally the borings will cave-in, preventing water level readings from being obtained or trapping drilling water above the cave-in zone. The cave-in depth is measured and recorded on the Boring Records.

Boring Records

The subsurface conditions encountered during drilling are reported on a field boring record prepared by the Driller. The record contains information concerning the boring method, samples attempted and recovered, indications of the presence of coarse gravel, cobbles, etc., and observations of ground water. It also contains the driller's interpretation of the soil conditions between samples. Therefore, these boring records contain both factual and interpretive information. The field boring records are kept on file in our office.

After the drilling is completed, a geotechnical professional classifies the soil samples and prepares the final Boring Records, which are the basis for all evaluations and recommendations. The following terms are taken from ASTM D2487 or Deere's Technical Description of Rock Cores for Engineering Purposes, Rock Mechanical Engineering Geology 1, pp. 18-22.

Relative Density of Cohesionless Soils From Standard Penetration Test	
Very Loose	‹ 4 bpf
Loose	5 - 10 bpf
Medium	11 – 30 bpf
Dense	31 - 50 bpf
Very Dense	› 50 bpf
(bpf = blows per foot, ASTM D 1586)	

Consistency of Cohesive Soils	
Very Soft	‹ 2 bpf
Soft	3 - 4 bpf
Medium	5 - 8 bpf
Stiff	9 - 15 bpf
Very Stiff	16 - 30 bpf
Hard	› 30 bpf

Relative Hardness of Rock
Very Soft Rock disintegrates or easily compresses to touch; can be hard to very hard soil.
Soft Rock may be broken with fingers.
Moderately Soft Rock may be scratched with a nail, corners and edges may be broken with fingers.
Moderately Hard Rock a light blow of hammer is required to break samples.
Hard Rock a hard blow of hammer is required to break sample.

Particle Size Identification	
Boulders	Larger than 12"
Cobbles	3" - 12"
Gravel	
Coarse	3/4" - 3"
Fine	4.76mm - 3/4"
Sand	
Coarse	2.0 - 4.76 mm
Medium	0.42 - 2.00 mm
Fine	0.42 - 0.074 mm
Fines (Silt or Clay)	Smaller than 0.074 mm

Rock Continuity

RECOVERY = $\frac{\text{Total Length of Core}}{\text{Length of Core Run}}$ x 100 %

Description	Core Recovery %
Incompetent	Less than 40
Competent	40 - 70
Fairly Continuous	71 - 90
Continuous	91 - 100

Relative Quality of Rocks

RQD = $\frac{\text{Total core, counting only pieces › 4" long}}{\text{Length of Core Run}}$ x 100 %

Description	RQD %
Very Poor	0 - 25 %
Poor	25 - 50 %
Fair	50 - 75 %
Good	75 - 90 %
Excellent	90 - 100 %

GMC

LABORATORY TESTING

GENERAL

The laboratory testing procedures employed by Goodwyn Mills Cawood, LLC (GMC) are in general accordance with ASTM standard methods and other applicable specifications. Several test methods, described together with others in this Appendix, were used during the course of this exploration. The Laboratory Data Summary sheet indicates the specific tests performed.

SOIL CLASSIFICATION

Soil classifications provide a general guide to the engineering properties of various soil types and enable the engineer to apply past experience to current problems. In our investigations, samples obtained during drilling operations are examined in our laboratory and visually classified by an engineer. The soils are classified according to consistency (based on number of blows from standard penetration tests), color and texture. These classification descriptions are included on our "Boring Records".

The classification system discussed above is primarily qualitative and for detailed soil classification, two laboratory tests are commonly performed: grain size tests and plasticity tests. Using these test results the soil can be classified according to the AASHTO or Unified Classification Systems (ASTM D2487). Each of these classification systems and the in-place physical soil properties provides an index for estimating the soil's behavior. The soil classification and physical properties obtained are presented in this report.

POCKET PENETROMETER TEST

A pocket penetrometer test is performed by pressing the tip of a small, spring-loaded penetrometer with even pressure to a prescribed depth into a soil sample. This test yields a value for unconfined compressive strength, which may be correlated with unconfined compressive strengths obtained by other laboratory methods.

MOISTURE CONTENT

Moisture contents are determined from representative portions of the specimen. The soil is dried to a constant weight in an oven at 100° C and the loss of moisture during the drying process is measured. From this data, the moisture content is computed.

ATTERBERG LIMITS

Liquid Limit (LL), Plastic Limit (PL) and Shrinkage Limit (SL) tests are performed to aid in the classification of soils and to determine the plasticity and volume change characteristics of the materials. The Liquid Limit is the minimum moisture content at which a soil will flow as a heavy viscous fluid. The Plastic Limit is the minimum moisture content at which the soil behaves as a plastic material. The Shrinkage Limit is the moisture content below which no further volume change will take place with continued drying. The Plasticity Index (PI) is the numeric difference of Liquid Limit and Plastic Limit and indicates the range of moisture content over which a soil remains plastic. These tests are performed in accordance with ASTM D4318, D4943 and D427.

PARTICLE SIZE DISTRIBUTION

The distribution of soils coarser than the No. 200 (75-mm) sieve is determined by passing a representative specimen through a standard set of nested sieves. The weight of material retained on each sieve is determined and the percentage retained (or passing) is calculated.

A specimen may be washed through only the No. 200 sieve, if the full range of particle sizes is not required. The percentage of material passing the No. 200 sieve is reported.

The distribution of materials finer than the No. 200 sieve is determined by use of a hydrometer. The particle sizes and distribution are computed from the time rate of settlement of the different size particles while suspended in water. These tests are performed in accordance with ASTM D421, D422 and D1140.
